

Catalouge 2020.05

### About this catalogue

The purpose of this catalogue is to provide a down-loadable and printable collection of data sheets for our wide range of audio transformers. It also includes some of our technical papers of more general interest.

In the "Quick selection guide" we have grouped the transformers based on their most common application. But if you know which transformer model you are looking for, you might prefer to search the catalogue in strict type number order. In that case, please use the bookmarks icon in the menu to the left.

For additional information about Lundahl Transformers please visit our website, www.lundahltransformers.com

For news and updates, follow us in social media, Facebook, www.facebook.com/lundahltransformers Instagram, www.instagram.com/lundahltransformers LinkedIn, www.linkedin.com/company/lundahl-transformers-ab

Over the past several years we have had the pleasure of meeting many of you at our booth at audio exhibitions in Europe and in the United States.

Thank you very much for the visits and for all the nice comments about our products.

We welcome your appreciation with great pride, and feel a big responsibility to justify your confidence by continuing to deliver excellent products in the coming years.

Per Lundahl Managing Director

### TRANSFORMERS MOSTLY USED IN PRO AUDIO APPLICATIONS

Line input transformers

| Туре    | Turns ratio       | Level (@50 Hz) | Usage / Comment                          |
|---------|-------------------|----------------|--|
| LL1531  | 1+1 : 1+1         | +20 dBU        | Line input. Small size                   |
| LL1540  | 1+1 : 1+1         | +30 dBU        | High level line input                    |
| LL1544A | 1+1+1+1 : 2+2     | +20 dBU        | Line input. Amorphous core               |
| LL1545A | 1+1+1+1 : 2+2     | +24 dBU        | Line input                               |
| LL1545E | 1+1:1+1           | +24dBU         | Line input, based on LL1545A             |
| LL1592  | 1+1 : 1+1         | +30 dBU        | High quality line input.                 |
| LL1922  | 1+1 : 4+4         | +26 dBU        | Line step-up input. Similar to UTC LS-10 |
| LL1952  | 1 & 4 : 4         | +7 dBU+19 dBU  | Mic & Line input transformer             |
| LL6404  | 1:1               | N/A (High!)    | Zero Field line input                    |
| LL7101  | 1+1 : 1.37        | N/A (High!)    | Zero Field line input                    |
| LL7901  | 1+1+1+1 : 1+1+1+1 | +34 dBU        | Very high level line input               |

Line output transformers

| atput transformers |                 |                |   |  |
|--------------------|-----------------|----------------|---|--|
| Type               | Turns ratio     | Level (@50 Hz) | Usage / Comment                         |  |
| LL1517             | 1+1,ct : 1+1    | +28 dBU        | With Faraday shields. General purpose.  |  |
| LL1524             | 1+1 : 1+1       | +28 dBU        | Balanced drive.                         |  |
|                    |                 |                | Very low leakage inductance.            |  |
| LL1539             | 2:1+1           | +31 dBU        | Balanced drive                          |  |
| LL1555             | 1+1+1+1 : 2+2   | +27 dBU        | Balanced drive                          |  |
| LL1560             | 2+2 : 1+1+1+1   | +26 dBU        | Balanced drive. 4 output active split.  |  |
|                    |                 | each secondary |   |  |
| LL1582             | 1+1 : 1+1       | +30 dBU        | With Faraday shields. General purpose.  |  |
|                    |                 |                | Size optimized for Euroboard            |  |
| LL1585             | 1+1 : 1+1       | +31 dBU        | With Faraday shields. General purpose.  |  |
| LL2734             | 1+1 : 1.4 + 1.4 | +30 dBU        | Solid State Single End                  |  |
|                    | 1+1 : 1+1       | +30 dBU        | Balanced drive. Low leakage inductance. |  |
| LL2811             |                 |                | Size optimized for Euroboard            |  |
| LL5402             | 2 : 1+1         | +22 dBU        | Unbalanced drive                        |  |
| LL7401             | 1+1 : 1+1       | +24 dBU        | Balanced drive. Low profile.            |  |
|                    |                 |                | Very low leakage inductance.            |  |

General purpose transformers, for splitting and electrical isolation.

| Type     | Turns ratio       | Level (@50 Hz) | Usage   |
|----------|-------------------|----------------|---|
| LL1527   | 1+1 : 1+1         | +16 dBU        | Split 1:1 direct + 1 isolated. Audio isolation  |
| LL1527XL | 1+1 : 1+1         | +19 dBU        | Split 1:1 direct + 1 isolated. Audio isolation  |
| LL1532   | 1+1:2             | +10 dBU        | Mic input. Audio isolation                      |
| LL1570   | 1+1 : 1+1         | +16 dBU        | Split 1 : 1direct + 1 isolated. Audio isolation |
| LL1570XL | 1+1 : 1+1         | +19 dBU        | Split 1 : 1direct + 1 isolated. Audio isolation |
| LL1581XL | 1:1+1             | +13 dBU        | Splitting 1:1 direct + 2 isolated               |
| LL1583   | 1:1+1             | +8 dBU         | Splitting 1:1 direct + 2 isolated. Small size   |
| LL1588   | 1+1 : 1+1         | +22 dBU        | High level line isolation transformer           |
| LL1590   | 1:1+1+1           | +15 dBU        | Splitting 1:1 direct + 3 isolated               |
| LL1591   | 1+1 : 1+1         | +16 dBU        | Low price audio isolation transformer           |
| LL1593   | 1+1:2             | +12 dBU        | Small, low price audio isolation transformer    |
| LL1944   | 1+1 : 1+1+1+1     | +28 dBU        | Mic split for speaker box etc.                  |
| LL7902   | 1+1+1+1 : 1+1+1+1 | +28 dBU        | For high level applications, input and output.  |
| LL7904   | 1:1+1             | +23 dBU        | High level splitting 1:1 direct + 2 isolated    |

#### DIN units. Transformer units with screw connectors for audio installations

| 41 | iits. Transioniici ain | CS WICH SCIEW        | connectors for additions                              |
|----|------------------------|----------------------|---|
|    | Type                   | Max level<br>@ 50 Hz | Usage / Comment                                       |
|    | DIN1527                | +16 dBU              | Galvanic isolation and balanced-unbalanced conversion |
|    | DIN1581XL              | +13 dBU              | Splitting 1 direct + 2 isolated                       |
|    | DIN1588                | +22 dBU              | High signal level galvanic isolation etc.             |

#### Microphone transformers

| Туре      | Turns ratio         | Level (@50 Hz) | Usage / Comment   |
|-----------|---------------------|----------------|---|
| LL1528    | 1+1 : 2.5+2.5       | +10 dBU        | 200Ω: 5k microphone input   |
| LL1530    | 1+1: 3.5+3.5        | +10 dBU        | DI (Direct Input) 10k : 200Ω  |
| LL1538*   | 1+1 : 5             | +10 dBU        | $200\Omega$ : 5k microphone input                                     |
| LL1538XL* | 1+1 : 5             | +13 dBU        | High level $200\Omega$ : 5k microphone input.                         |
| LL1550    | 1+1+1+1 : 4+4       | +6 dBU         | Special application input. Amorphous core                             |
| LL1571    | 1+1 : 1.75+1.75     | +10 dBU        | 200Ω: 2k5 microphone input  |
| LL1576*   | 1+1:7               | +10 dBU        | 200Ω: 10k microphone input  |
| LL1577*   | 1+1 : 14            | +4 dBU         | 50Ω: 10k microphone input   |
| LL1578*   | 1+1 : 10            | +4 dBU         | 50Ω: 5k microphone input  |
| LL1578XL* | 1+1 : 10            | +7 dBU         | High level $50\Omega$ : 5k microphone input.                          |
| LL1587    | 1+1 : 4             | +0 dBU         | Small size $200\Omega$ : $3k2$ microphone input                       |
| LL1636    | 1+1+1+1 : 10+10     | -2 dBU         | Special application input. Amorphous core                             |
| LL1926    | 1+1+1+1:4+4         | +13 dBU        | Mu metal version of LL1550  |
| LL1927A   | 1+1 : 55 + 55       |                | Very high turns ratio. For ribbon mics.                               |
| LL1935    | 1+1 : 5 + 5         | +7 dBU         | DI (Direct Input) 20k : 200Ω  |
| LL1936    | (2+1) + (2+1) : 4+4 | +14 dBU        | $75\Omega$ , $150\Omega$ , $300\Omega$ and $600\Omega$ : $1200\Omega$ |
| LL1940    | 9:1+1               | 45V RMS        | Tube mic output with "character"                                      |
| LL1951*   | 1+1 : 14            | +4 dBU         | Improved LL1577   |
| LL2912    | 1:37                | -30 dBU (1:37) | For ribbon microphones. Amorphous core.                               |
| LL2913    | 1+1+1+1 : 37        | -30 dBU (1:37) | For ribbon microphones. Amorphous core.                               |
| LL2914    | 1+1+1+1 : 37        | -30 dBU (1:37) | For ribbon microphones. Mu metal core.                                |
| LL2915    | 1:37                | -30 dBU (1:37) | For ribbon microphones. Mu metal core.                                |
| LL2916    | 1+1 : 55 + 55       |                | Mu metal core version of LL1927A                                      |
| LL7903    | 1+1+1+1 : 2+2+2+2   | +28 dBU        | Very high level mic/line input.                                       |
| LL7903Ag  | 1+1+1+1 : 2+2+2+2   | +28 dBU        | Silver wire version of LL7903   |
| LL7906    | 1+1+1+1 : 5.6 + 5.6 | +16 dBU        | High level mic/line input.  |

Transformers marked with \* have compatible pinout.

#### XLR-XLR problem solvers units (all units with turns ratio 1:1)

| Type           | Max level<br>@ 50 Hz | Usage / Comment   |                 |
|----------------|----------------------|---|-----------------|
| LL6810-phmphm  | +15 dBU              | Isolation transformer unit<br>Phono - Phono w. 6 ft cable |                 |
| LL156X-3FX3MX  | +24 dBU              | XLR female to XLR male                                    | line input      |
| LL156X-3FXPHM  | +24 dBU              | XLR female to Phono male                                  | line input      |
| LL156X-3FXNP2C | +24 dBU              | XLR female to 2 pole 1/4" plug                            | line input      |
| LL156X-PHF3MX  | +24 dBU              | Phono female to XLR male                                  | line input      |
|                |                      |   |                 |
| LL1584-3FX3MX  | +16 dBU              | XLR female to XLR male                                    | general purpose |
| LL1584-3FXPHM  | +16 dBU              | XLR female to Phono male                                  | general purpose |
| LL1584-3FXNP2C | +16 dBU              | XLR female to 2 pole 1/4" plug                            | general purpose |
| LL1584-PHF3MX  | +16 dBU              | Phono female to XLR male                                  | general purpose |
| SIB15          | +12 dBU              | Stereo Isolation and Balancing unit (PC to                | Pro)            |

#### Miscellaneous transformers

| Type   | Turns ratio                | Usage / Comment                              |
|--------|----------------------------|--|
| LL1572 | 110 : 110 ohms             | Digital audio isolation. Replaces LL1566     |
| LL1573 | 110 : 110 + 110 ohms       | Digital audio split, 2 isolated out.         |
| LL1574 | 110 : 75 ohms              | Digital Audio AES/EBU : SPDIF interface      |
| LL1575 | 1:1                        | Composite video isolation                    |
| LL1589 | 110 : 110 + 110 + 110 ohms | Digital audio split, 3 isolated out.         |
| LL2410 | 2+2+2+2 : 1+1+1+1+1+1+1    | General purpose 100V loudspeaker transformer |
| LL6702 | N/A                        | Telephone hybrid transformer                 |

#### TRANSFORMERS FOR TUBE AMPLIFIERS AND OTHER AUDIOPHILE APPLICATIONS

Tube amplifier output transformers

| Туре          | Primary                | Secondary     | Comments                 |
|---------------|------------------------|---------------|--------------------------|
| LL1620        | 3.3k, 6.0k or 11.5k    | 4, 8, 16 ohms |                          |
| LL1620CFB 8%  | 3.3k, 6.0k or 11.5k    | 4, 8, 16 ohms | For cathode feedback     |
| LL1620CFB 25% | 3.3k, 6.0k or 11.5k    | 4, 8, 16 ohms | For cathode feedback     |
| LL1623        | 1.6k, 3.0k or 5.6k     | 4, 8, 16 ohms |                          |
| LL1627        | 650 ohms, 1.2k or 2.3k | 4, 8, 16 ohms |                          |
| LL1663        | 5k                     | 8 ohms        | Small size               |
| LL1664        | 3k                     | 8 ohms        | Small size               |
| LL1679        | 2.6k, 4.5k, 9.7k       | 4, 8, 16 ohms | UL taps                  |
| LL1682        | 5.5k                   | 5 ohms        | Small size               |
| LL1688        | 5.5k, 9.2k, 20.5k      | 4, 8, 16 ohms | Big size                 |
| LL1691        | 9k                     | 8 ohms        | Big size                 |
| LL1691B       | 18k                    | 8 ohms        | Big size                 |
| LL1693        | 600 ohms, 1k or 2.3k   | 4, 8, 16 ohms | High power               |
| LL2735B       | 16k                    | 8 ohms        | For SE                   |
| LL2752        | 1.2k, 2.0k, 4.6k       | 4, 8, 16 ohms | Silver version available |
| LL2755        | 11k                    | 8 ohms        | Big size. For 813 etc.   |
| LL2766        | 3k, 6k                 | 4, 8 16 ohms  | Small size               |

# "100V Line" Loudspeaker transformers

### 140V systems

Auto transformer LL2415, LF: 50 Hz/140 V

| Taps Voltage (V)<br>(at 140V primary voltage) | Power @ 8 ohms<br>(W) | Power @ 16 ohms (W) |
|---|-----------------------|---------------------|
| 16  | 32                    | 16                  |
| 24  | 72                    | 36                  |
| 32  | 128                   | 64                  |
| 35  | 153                   | 76                  |

Auto transformer LL2416, LF: 50 Hz/140 V

| Taps Voltage (V)<br>(at 140V primary voltage) | Power @ 8 ohms<br>(W) | Power @ 16 ohms (W) |
|---|-----------------------|---------------------|
| 8   | 8                     | 4                   |
| 16  | 32                    | 16                  |
| 24  | 72                    | 36                  |
| 32  | 128                   | 64                  |
| 48  | 288                   | 144                 |

LL2415 and LL2416 can also be used in 100V systems. LF: 36Hz@100V Each tap voltage is reduced with approx. 29% Each tap power level is reduced with 50%

#### 70V systems

Auto transformer LL2417, LF: 50 Hz / 70V

| Taps Voltage (V) (at 65V primary voltage) | Power @ 8 ohms<br>(W) | Power @ 16 ohms (W) |
|---|-----------------------|---------------------|
| 21  | 50                    | 25                  |

#### 100V systems

Full transformer LL3610, LF: 100Hz@100V

| Taps Voltage (V) (at 100V primary voltage) | Power @ 8 ohms<br>(W) | Power @ 16 ohms (W) |
|--|-----------------------|---------------------|
| 2.8V                                       | 1                     | 0.5                 |

(Each LL3610 is designed to feed up to 20 x 80hms loudspeaker elements connected in parallel)

# **General Purpose High Power Transformer LL2410**

Our transformer LL2410 and its' descendants are general purpose high power loudspeaker transformers. The transformer is extremely flexible and well suited for applications with power levels from 250W and up, line voltage from 70V to 140V. The transformer can be configured as auto transformer or full transformer.

This transformer is e.g. used in the loudspeaker systems of Nya Ullevi in Gothenburg and Råsunda Stadium in Stockholm.

LL1517 is an audio output transformer for balanced or unbalanced drive. The transformer is built from two three-section coils, with primaries and secondaries separated by electrostatic shields, and a audio C-core of our own production. The transformer is housed in a mu-metal housing.

The LL1517 has sufficient low copper resistance to meet broadcast specifications in a conventional drive configuration, but is (as all output transformers) ideally used with mixed feedback drive circuits. (See separate paper for mixed feedback design principles).

# **Audio Output Transformer** LL1524

LL1524 is an audio output transformer for balanced drive. The LL1524 is a 5-section output transformer. This results in a very low leakage inductance and thus excellent HF characteristics.

The LL1524 is (like all C-core audio output transformers) ideally used with negative source impedance achieved using mixed feedback drive circuits. See separate paper for mixed feedback design principles.

# **General Purpose Transformers LL1527 and LL1527XL**

LL1527 is a truly general purpose transformer for microphone or line input, for output and for galvanic isolation of units. LL1527 has been generally accepted by the audio industry as the general purpose audio transformer. The LL1527 is built-up from two coils, each with one primary and one secondary winding separated by an electrostatic shield. The core is a high permeability mu metal core. The transformer is housed in a mu-metal can. In the LL1527XL, the core is about 45% larger than in the LL1527, resulting in a larger level capability.

# **Microphone Transformer / D-I Box Transformer** LL1530

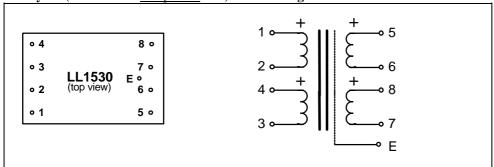

LL1530 is a microphone input transformer used for matching a 200 or 800  $\Omega$  microphone to 10 k $\Omega$  or for matching a high impedance source to a microphone input.

The transformer consists of two coils, each with one primary and one secondary winding separated by an electrostatic shield, and a high permeability mu-metal core. The transformer is encapsulated in a mu-metal case for magnetic shielding.

For best performance, the high impedance side of the transformer (3.5 + 3.5) should be connected in series.

# High Impedance Line Input Transformer LL1531

LL1531 is a small size, high impedance line input transformer for bridging input applications

The transformer consists of two coils, each with one primary and one secondary winding separated by an electrostatic shield. The two secondary windings are internally connected in series.

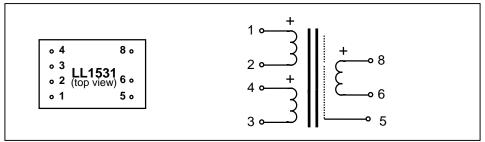

The core is a high permeability mu-metal lamination core.

The transformer is magnetically shielded by a mu-metal housing.

Being a high impedance transformer, the LL1531 should normally be used with primaries connected in series.

Turns ratio: 1+1:2Dims (Length x Width x Height above PCB (mm)):  $28 \times 17 \times 15$ 

Pin layout (viewed from component side) and winding schematics:

## General Purpose Audio Transformers LL1532 and LL1593

LL1532 and LL1593 are small size medium impedance transformers suitable for splitting and other general purpose applications.

LL1532 consists of two coils each with one primary and one secondary winding separated by an electrostatic (Faraday) shield. The two secondary windings are internally connected in series. The core is a high permeability mu-metal core. The LL1532 is magnetically shielded by a mu-metal housing.

LL1593 is a **low-cost version** of the LL1532, with the same winding structure but without Faraday shields and mu-metal housing.

The LL1532 and LL1592 can be used with primaries in series for 1:1 or in parallel for 1:2 turns ratio.

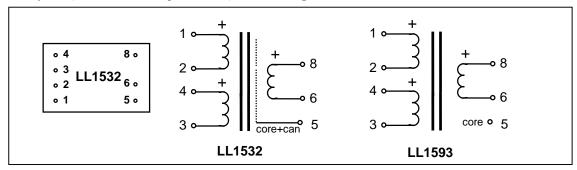

Turns ratio:

# **Microphone Input Transformers LL1538 and LL1538XL**

The LL1538 and the LL1538XL are high performance microphone input transformers, each with a high permeability mu-metal core and two three-section coils.

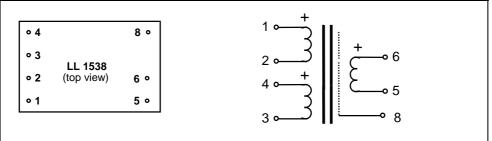

In the LL1538XL the core is about 45% larger than in the LL1538, resulting in a larger level capability. In both types, primary and secondary windings are separated by electrostatic shields. The three-section winding structure of the transformers results in a very low leakage inductance and thus an excellent frequency response.

The transformers are encapsulated in mu-metal cases for magnetic shielding.

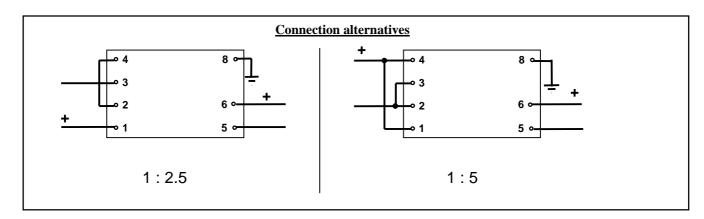

Turns ratio: 1 + 1 : 5

Pin layout (viewed from component side) and winding schematics:

# Audio Output Transformer LL1539

LL1539 is an audio output transformer for balanced drive.

In LL1539, the winding arrangement is such that (properly connected) the secondary windings are surrounded by cold (neutral) parts of the primary windings. This reduces the effect of the capacitance between the primary and the secondary windings. Thus, primaries should always be connected as in the application example below, with or without current feedback drive (negative source impedance).

Turns ratio: 2:1+1Dims (Length x Width x Height above PCB (mm)):  $47 \times 34 \times 21$ 

Pin layout (viewed from component side) and winding schematics:

**Spacing between pins:** 5.08 mm (0.2") **Spacing between rows of pins:** 35.56 mm (1.4")

**Weight:** 130 g

**Rec. PCB hole diameter:** 1.5 mm

Static resistance of each primary half (4 -- 1&6 or 3 -- 2&5 respectively):  $20 \Omega$ Static resistance of each secondary:  $20 \Omega$ Secondary leakage inductance (secondaries in series): 0.6 mH

**No-load impedance:**  $>2 \text{ k}\Omega \text{ } @ 50 \text{ Hz}, +20 \text{ dBU}$ 

Optimum source impedance: Minus 40  $\Omega$  Balance of output (according to IRT, source < 10  $\Omega$ , load 600  $\Omega$ ): > 65 dB

Maximum output level before saturation (load 600  $\Omega$ ): + 24 dBU @20Hz

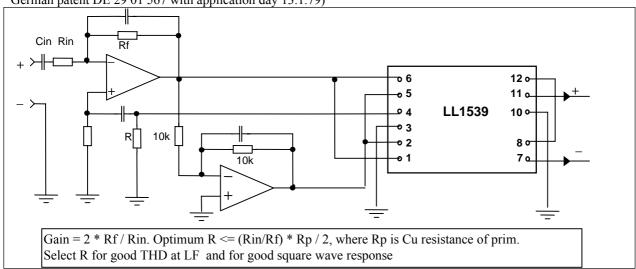

**Frequency response** (@ 10 dBU, source < 10  $\Omega$ , load 600  $\Omega$ ): 20 Hz -- 60 kHz +/- 0.3 dB

**Voltage loss across transformer** (at midband with 600  $\Omega$  load): 1 dB

Isolation between primary and secondary windings / between

windings and core: 4 kV / 2 kV

**Application example:** This schema shows the principles of mixed feedback circuitry for eliminating transformer-induced distortion and for reducing output impedance. (**NOTE**! This application was covered by a now outdated German patent DE 29 01 567 with application day 13.1.79)

#### **Audio Transformer LL1544A**

LL1544A is a line input / general purpose audio transformer which can be used in many different applications ranging from bridging input to microphone input applications. The transformer is built up from two threesection coils with interleaved Faraday shields. The core is a two-component amorphous strip core. This core type combines a high sensitivity for very low signal levels with excellent high-level capabilities. In addition, as this type of core does not store energy (unlike conventional mu-metal cores), at low frequencies phase response is excellent and resonance with a series capacitor is practically eliminated.

The LL1544A replaces previous types LL1544 and LL1554.

# **Audio Transformer** LL1545A

LL1545A is a general-purpose audio transformer with a variety of connection alternatives. The transformer is built up from two coils, each with a secondary winding surrounded by shields and two primary windings. This structure results in an excellent frequency response. The transformer can be used in many different applications such as a high impedance line input transformer (accepting signal levels of 22 dBU @ 40 Hz with primaries in series), for splitting or as a microphone input transformer.

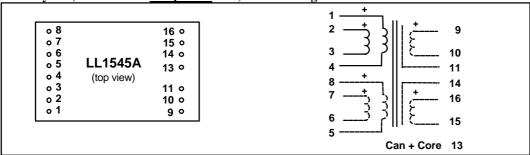

The LL1545A is made with a mu-metal core and is housed in a mu-metal can.

Refer to page 2 of this sheet for termination alternatives.

# LL1545A Connection alternatives (Left side is input if not stated otherwise)

!!!! Pin side view !!!!

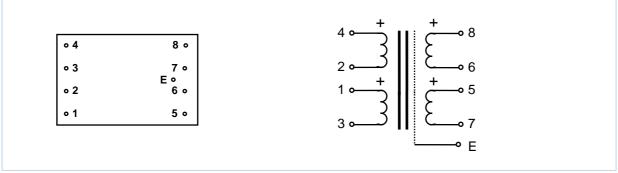

# Line input transformer LL1545E (Based on LL1545A, but with all windings symmetrical)

LL1545E is an audio transformer primarily designed for line input applications. The transformer consists of two primary and two secondary windings. The primary and secondary sections are separated by Faraday shields. All windings are internally split between coils which increase the flexibility of the transformer, as windings can be connected in series, in parallel or individually without a risk of using the transformer asymmetrically.

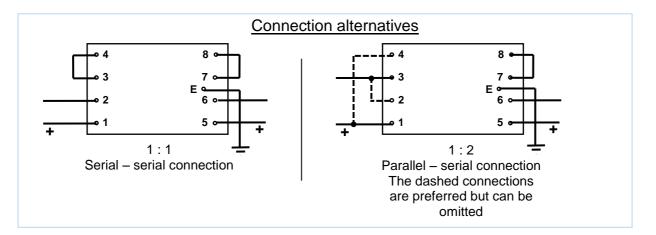

The LL1545E is made with a mu-metal lamination core and is housed in a mu-metal can.

Turns ratio: 1 + 1 : 1 + 1Dims (Length x Width x Height above PCB (mm)):  $38 \times 24 \times 17$ 

Pin layout (viewed from component side) and winding schematics:

| Spacing between pins:  | 5.08 mm (0.2")                       |
|--|--------------------------------------|
| Spacing between rows of pins:  | 27.94 mm (1.1")                      |
| Offset of earth pin from adjacent row:   | 2.54 mm (0.1")                       |
| Weight:  | 51 g                                 |
| Rec. PCB hole diameter:  | 1.5 mm                               |
| Static resistance of each winding:   | $295\Omega$                          |
| <b>Distortion</b> (primaries connected in series, source impedance $600\Omega$ ):  | + 22 dBU primary level, 40 Hz: 0.2 % |
| Frequency response (source $600\Omega$ , load $100k\Omega$ ) (HF frequency response can be improved with RC termination) | 5 Hz - 45 kHz +/- 1 dB @ 0dBU        |
| Self-resonance point:  | ~ 140 kHz                            |
| Isolation between primary and secondary windings/ between windings and shield/ between windings in same group            | 3 kV / 1.5 kV / 1 kV                 |

In situations where you have balanced AND unbalanced input, and the unbalanced input signal level drops 6dB, you can use the serial-serial connection for balanced input and the parallel-serial connection without the dotted connection for the unbalanced input. Note that unbalanced cold should be isolated from ground.

# Audio Transformer LL1550

LL1550 is an audio transformer with rather high turns ratio and with a variety of connection alternatives. The transformer is built up from two coils, each with a secondary winding surrounded by shields and two primary windings. This structure results in an excellent frequency response. All winding ends are available on the pins. The transformer is ideally used in applications where the high turns ratio is utilized, e.g. in a D.I. box. The LL1550 is made with amorphous core material. As this type of core does not store energy (unlike conventional mu-metal cores) the low frequency resonance with external capacitors is practically eliminated. Refer to the back side of this sheet for termination alternatives.

Turns ratio: 1+1+1+1:4+4Dims: (Length x Width x Height above PCB (mm))  $30 \times 22.5 \times 14.5$

# **Audio Output Transformer** LL1555

LL1555 is an audio output transformer for balanced drive. The winding arrangement is such that, connected as shown below, each secondary winding is surrounded by cold primary winding ends. The transformer is ideally used with a mixed feedback drive circuit (refer to our separate sheet). The secondaries can be connected in parallel (for low output impedance) or in series.

The LL1555 is made with an audio C-core of our own production and is housed in a mu-metal housing.

# **Audio Split Transformer LL1560**

LL1560 is an audio transformer specially built for active splitting.

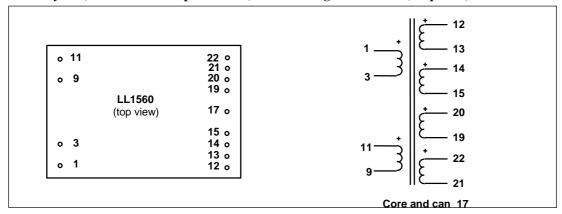

Each of the four secondary windings is surrounded by primary winding parts. This results in a low leakage inductance and ensures that output signal is maintained on three of the secondary windings even if one is shortcircuited, provided of course that driving power is available.

The primary windings should be used in parallel.

# Transformers for splitting **LL1570 and LL1570XL**

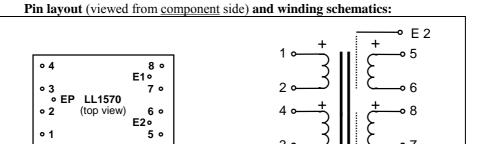

The LL1570 is designed for splitting signals in application where large ground differences may appear, but is also very useful as a general purpose audio transformer. By careful design, the capacative coupling between the different part of the transformer is kept to a minimum. The three-section winding structure which is necessary for decoupling also results in a very high bandwidth. The transformer is built up from two coils, each with primary and secondary windings separated by electrostatic shields, and a high permeability mu-metal core. The two coil structure in combination with the mu-metal can results in high immunity to external magnetic fields.

In the LL1570XL, the core is about 45% larger than in the LL1570, resulting in a larger level capability.

#### **Turns ratio:**

# **Microphone Input Transformer** LL1571

LL1571 is a microphone input transformer built up from two coils and a high permeability mu metal core. Each coil is wound in three sections with electrostatic shields connected to separate pins. This result in a transformer with a very broad band, also ideal for splitting purpose. The two-coil structure in combination with the mu-metal can results in a high immunity to external magnetic fields.

**Turns ratio:** 1+1:1.75+1.75Dims (Length x Width x Height above PCB (mm)): 38 x 24 x 17

# **Digital audio transformers** LL1572 (1:1), LL1573 (1:1:1) and LL1589 (1:1:1:1)

The LL1572, LL1573, LL1589 are pulse transformer designed for digital audio. They are designed with a rather large amorphous metal core and have thus low copper resistance, high signal tolerance and low internal capacitance. The amorphous core has a very high mu. Thus, when used, the transformer should be protected from DC current.

# Microphone Input Transformers, Line-box Transformers LL1576 and LL1577

The LL1576 and the LL1577 are high performance microphone input transformers/line-box transformers with high permeability mu-metal cores and high bandwidth coils. The LL1576 and the LL1577 use the same pin-out as our well known microphone transformer LL1538.

In both types, primary and secondary windings are separated by electrostatic shields. The very low leakage inductance and thus excellent frequency response is achieved by a two-coil, three-section per coil winding structure.

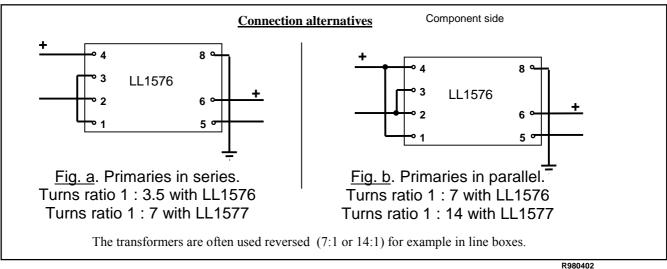

The transformers are encapsulated in mu-metal cases for magnetic shielding.

#### Pin layout (component side view) and winding schematics:

# LL1581XL Splitting Transformer

In many splitting applications, the splitting transformer must have a high immunity to input common mode signals, to stray magnetic fields from e.g. power transformers and to large ground potential differences in receiving systems. The LL1581XL is developed to handle those types of problems. When designing the LL1581, we have used our well established two coil structure to create a transformer with a high degree of symmetry. The transformer is built up from two primary windings (which should be used in parallel) and two secondary windings. Each secondary winding is built up from two sections, one from each coil. Its own electrostatic shields surround each secondary section. The symmetric structure results in an internal cancellation of noise signals caused by external magnetic field. It also increase immunity to ground noise between secondary systems and reduces the effects of input common mode signals. The transformer is housed in a mu-metal can and is impregnated in solventless epoxy resin.

**Turns ratio:** 1 + 1 : 1 + 1

# **Audio Output Transformer** LL1582

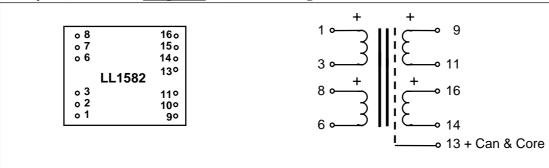

LL1582 is an audio output transformer for balanced or unbalanced drive, with the following features:

- 1. Pin compatible with the popular LL2811
- With internal shields to improve common mode passthrough rejection. This is important in analog output from digital systems.
- 3. Suggested use: 2:1 (secondaries in parallel) with e.g. NE5532 op amps for low noise.
- 4. Precision made audio C core for small size.
- 5. Two-coil structure and mu-metal housing for high magnetic noise immunity.
- 6. Designed to fit three in a row across a Euroboard.

The secondaries can be connected in parallel for low output impedance or in series for high output level.

# High level, 600 ohms to 600 ohms transformer unit <u>LL1584</u>

The XLR inline transformer unit LL1584 is designed for breaking up ground loops and for balanced-to-unbalanced conversion in mobile or stationary audio systems. The unit is magnetically shielded and contains a medium impedance isolation transformer LL1584, with LF saturation above +17 dBU @ 50 Hz.

The two ends of the units are galvanically isolated from each other.

The LL1584 is available in four versions:

**LL1584-3FXNP2C** Female XLR connector to 2-pole 'A'-gauge 1/4" jack plug **LL1584-PHF3MX** Female Phono (RCA) connector to male XLR connector

**LL1584-3FXPHM** Female XLR connector to Phono (RCA) male **LL1584-3FX3MX** Female XLR connector to male XLR connector

# **High Level Audio Output Transformer** LL1585

LL1585 is a high level audio line output transformer for balanced or unbalanced drive. The transformer is built from two three-section coils, with primaries and secondaries separated by electrostatic shields, and a audio Ccore of our own production. The transformer is housed in a mu-metal housing.

The LL1585 is (as all output transformers) ideally used with mixed feedback drive circuits. (See separate paper for mixed feedback design principles).

# **High Level General Purpose Transformer** LL1588

LL1588 is a high-level general-purpose transformer which can be used for microphone or line input, for line output and for galvanic isolation. The windings are arranged to give perfect symmetry if the transformer is used in phase splitting input applications. The two coils structure also greatly improves immunity to external magnetic fields from e.g. power supplies and motors. Primary and secondary windings are separated by electrostatic shields. The core is a high permeability mu metal core. The transformer is housed in a mu-metal can.

**Turns ratio:** 1 + 1 : 1 + 1

# LL1590 Splitting Transformer, 1 direct + 3 isolated

In many splitting applications, the splitting transformer must have a high immunity to input common mode signals, to stray magnetic fields from e.g. power transformers and to large ground potential differences in receiving systems. The LL1590 is developed to handle those types of problems. When designing the LL1590, we have used our well established two coil structure to create a transformer with a high degree of symmetry. The primary winding consists of four sections, two on each coil, connected in parallel. The three secondary windings consists each of two sections, one from each coil, separated from the primary sections by electrostatic shields. The symmetric structure results in an internal cancellation of noise signals caused by external magnetic field. It also increase immunity to ground noise between secondary systems and reduces the effects of input common mode signals.

The transformer is housed in a mu-metal can and is impregnated in epoxy resin.

# **Tube Amplifier Output Transformers** LL1620, LL1623, LL1627, LL9202

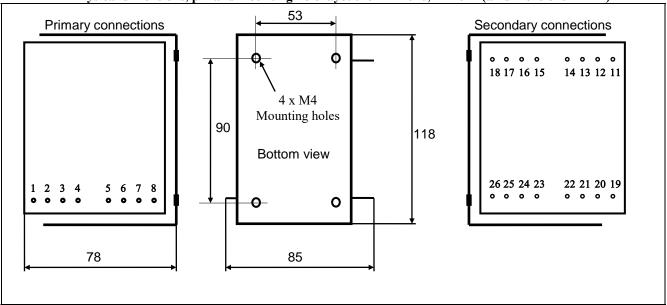

The LL1620, LL1623, LL1627 and LL9202 are output transformers for tube amplifiers. All transformers are based on the same core size, winding structure and secondaries, but differ in number of turns (and thus impedance level) of primaries.

The transformers are highly sectioned with harmonically sized sections, which results in a minimum leakage inductance. This, combined with a low capacitance coil winding technique results in a wide frequency range.

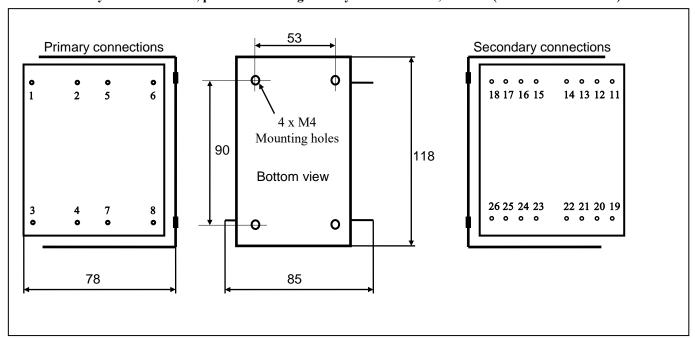

The transformers have a special audio C-core of our own production, which is gapped for desired DC current.

The transformers are of open frame type suitable for mounting inside an amplifier housing.

#### Our recommendations on how to choose your tube output transformer:

#### **Push-pull output stages:**

All our push-pull output transformers have a 25 microns core air gap to allow for a small DC unbalance of your output circuits.

Step 1 From your secondary load impedance (4, 8 or 16 ohms), we suggest a secondary connection alternative with 0.5 dB loss. This will give you a maximum power limit of 125W at 30 Hz, and a LF -1 dB point at 6.4 Hz for pentodes and lower still for triodes.

If you require more headroom at low frequencies, the 0.8 dB loss alternative expands the LF limit one octave.

Step 2 Your tube choice gives you a desired primary load impedance. Select the transformer type having a primary load impedance which best matches the desired impedance. The LL1623 (5.6 k $\Omega$  plate-to-plate impedance) or the LL1620 (6.0 k $\Omega$  plate-to-plate impedance) suits many tubes

like the 300B triode or the EL34 pentode. The 6C33 (low voltage, high current) requires a transformer LL1627 while high anode voltage tubes require the high impedance of the LL1620.

Footnote: In class A push-pull, each **tube** will see a load impedance = 1/2 transformer primary load impedance. In class B push-pull, each **tube** will see 1/4.

#### Single-end output stages:

The core of Single End output transformers have an airgap. The purpose of the airgap is to accept the DC current of the output tube without saturating the core, leaving enough headroom for the sound signal. As a result of the airgap, the primary inductance is lower for SE output transformers compared to P-P dittos. In addition, the inductance tends to vary with DC current. For our high quality C- cores with carefully ground surfaces, the variation is within +7% of rated value.

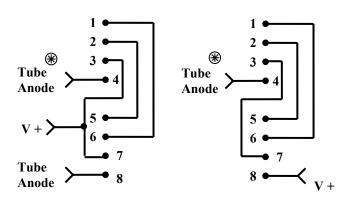

- Step 1 We recommend that, given your secondary load impedance (4, 8 or 16 ohms), you select a secondary connection alternative with 0.5 dB loss. This will give you a power limit of 25 W at 30 Hz. If you find that you require more bass headroom, select a secondary connection alternative with 0.8 dB loss.
- Step 2 From the tube load line you determine a primary load impedance. This results in a choice of transformer main type.
- Step 3 From the tube data sheet you also select your desired DC current. From the table above you select the transformer subtype (DC current) which best fits your needs. For many tubes such as the 300B and the EL34, the transformer LL1623 / 90 mA is the ideal choice.
- Step 4 We define **Power Low Frequency Limit, F**<sub>PL</sub>, as the frequency where  $\omega L_P = R_{LOAD}$ . (The reactive impedance of the transformer equals the primary load impedance). At F<sub>PL</sub>, the output power is reduced to 50%. For the LL1623 / 90 mA in a 0.5 dB loss connection, F<sub>PL</sub> = 16 Hz (R<sub>PRIMARY</sub> = 3.0 kohms and L<sub>P</sub> = 30H).
- Step 5 We define **Response Low Frequency Limit, F**<sub>RL</sub> as the frequency where a (small) output signal is reduced with -1 dB due to finite primary inductance.  $F_{RL} = \omega / \pi$ , if you solve  $\omega$  in  $\omega L_P = (R_{LOAD} \text{ in parallell with } R_{ANODE})$ . For the LL1623 / 90 mA and a 300B triode,  $F_{RL} = 7$  Hz. ( $R_{ANODE} = 650$  ohms,  $R_{PRIMARY} = 3.0$  kohms and  $L_P = 30$ H),

# Amorphous core output transformers

## LL1620AM, LL1623AM, LL1627AM, LL1679AM, LL9202AM

Some of our tube output transformers are now available with amorphous core. Listening tests, in particular for the PP versions where the core airgap is not as dominating as in SE applications, have reported a more transparent, wider bandwidth character than our silicon iron counterparts.

For connection alternatives and general application information, please refer to data sheets for our regular (silicon-iron) output transformers.

The obvious measurable difference between our silicon-iron cores and amorphous cores is that the saturation flux for the amorphous core is approximately 33% less than for the silicon-iron counterpart. This is caused partly by a lower saturating flux level, partly by a smaller fill-factor due to the thickness of the amorphous sheets.

As a result, power bandwidth is reduced by about 50%. (This means that if the max output power for a standard LL1620/40mA is 25W at 30 Hz, corresponding max. power for LL1620AM/40mA is 13W.)

This is probably not a problem in most Push-Pull applications, but should possibly be considered in Single End amplifiers.

#### Our recommendations on how to choose your tube output transformer

#### **Push-pull output stages:**

All our push-pull output transformers have a 25 microns core air gap to allow for a small DC unbalance of your output circuits.

- Step 1 From your secondary load impedance (4, 8 or 16 ohms), we suggest a secondary connection alternative with 0.5 dB loss. This will give you a maximum power limit of 125W at 30 Hz, and a LF -1 dB point at 6.4 Hz for pentodes and lower still for triodes.
  - If you require more headroom at low frequencies, the 0.8 dB loss alternative expands the LF limit one octave.
- Your tube choice gives you a desired primary load impedance. Select the transformer type having a primary load impedance which best matches the desired impedance.
   The LL1623 (5.6 kΩ plate-to-plate impedance) or the LL1620 (6.0 kΩ plate-to-plate impedance) suites many tubes like the 300B triode or the EL34 pentode. The 6C33 (low voltage, high current) requires a transformer LL1627 while high anode voltage tubes require the high impedance of the LL1620.
- Footnote: In class A push-pull, each **tube** will see a load impedance = 1/2 transformer primary load impedance. In class B push-pull, each **tube** will see 1/4.

#### **Single-end output stages:**

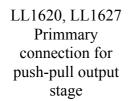

The core of Single End output transformers have an airgap. The purpose of the airgap is to accept the DC current of the output tube without saturating the core, leaving enough headroom for the sound signal. As a result of the airgap, the primary inductance is lower for SE output transformers compared to P-P dittos. In addition, the inductance tends to vary with DC current. For our high quality C- cores with carefully ground surfaces, the variation is within +7% of rated value.

- Step 1 We recommend that, given your secondary load impedance (4, 8 or 16 ohms), you select a secondary connection alternative with 0.5 dB loss. This will give you a power limit of 25 W at 30 Hz. If you find that you require more bass headroom, select a secondary connection alternative with 0.8 dB loss.
- Step 2 From the tube load line you determine a primary load impedance. This results in a choice of transformer main type.
- Step 3 From the tube data sheet you also select your desired DC current. From the table above you select the transformer subtype (DC current) which best fits your needs. For many tubes such as the 300B and the EL34, the transformer LL1623 / 90 mA is the ideal choice.
- Step 4 We define **Power Low Frequency Limit, F**<sub>PL</sub>, as the frequency where  $\omega L_p = R_{LOAD}$ . (The reactive impedance of the transformer equals the primary load impedance). At  $F_{PL}$ , the output power is reduced to 50%. For the LL1623 / 90 mA in a 0.5 dB loss connection,  $F_{PL} = 16$  Hz ( $R_{PPLMAPV} = 3.0$  kohms and  $L_p = 30$ H).
- LL1623 / 90 mA in a 0.5 dB loss connection,  $F_{PL} = 16 \, \text{Hz}$  ( $R_{PRIMARY} = 3.0 \, \text{kohms}$  and  $L_P = 30 \, \text{H}$ ). Step 5 We define **Response Low Frequency Limit, F\_{RL}** as the frequency where a (small) output signal is reduced with -1 dB due to finite primary inductance.  $F_{RL} = \omega / \pi$ , if you solve  $\omega$  in  $\omega L_P = (R_{LOAD} \text{ in parallell with } R_{ANODE})$ . For the LL1623 / 90 mA and a 300B triode,  $F_{RL} = 7 \, \text{Hz}$ . ( $R_{ANODE} = 650 \, \text{ohms}$ ,  $R_{PRIMARY} = 3.0 \, \text{kohms}$  and  $L_P = 30 \, \text{H}$ ),

Domestic 0176-13930 0176-13935

# **Microphone Input Transformer** LL1636

LL1636 is an audio input transformer for applications where a high turn's ratio is desired. The transformer is built up from two coils, each with a secondary winding surrounded by shields and two primary windings. This structure results in an excellent frequency response. All winding ends are available on the pins. Thus, the transformer can be configured for a number of different turn's ratios.

The LL1636 is made with amorphous core material. As this type of core does not store energy (unlike conventional mu-metal cores) the low frequency resonance with external series capacitors is practically eliminated.

**Turns ratio:** 1 + 1 + 1 + 1 : 10 + 10Dims: (Length x Width x Height above PCB (mm)) 30 x 22.5 x 14.5

Pin Layout (viewed from pins side) and Windings Schematics:

**Spacing between pins:** 2.54 mm (0.1") 22.86 mm (0.9") Spacing between rows of pins: Weight: 27 g

Rec. PCB hole diameter: 1.5 mm

 $10 \Omega$ Static resistance of <u>each</u> primary (average): Static resistance of each secondary (average):  $415 \Omega$ **Self resonance point:** > 250 kHz

Frequency response

 $(@ -10 \text{ dBU}, \text{ all in series. Source } 50\Omega \text{ , load } 100 \text{ k}\Omega)$ : 10 Hz -- 25 kHz +/- 1 dB

10 Hz -- 90 kHz +/- 1.5 dB

**Distortion** (primaries connected in series, source impedance  $50\Omega$ ): < 0.5% @ -2 dBU, 50 Hz

Primary no load impedance @ 0 dBU, 50 Hz, all in series:  $8 \text{ k}\Omega$  typically

## Tube Amplifier Interstage Transformer / Line Output Transformer LL1660

LL1660 is an interstage / line output transformer for tube amplifiers. The transformer is available with different core air gap for PP or SE drives.

The transformer is wound with a special low capacitance winding technique to achieve best high frequency performance. The transformer has a special high flux, low distortion audio C-core of our own production. The LL1660PP is assembled with a small core air gap to allow for some DC current unbalance.

For the S.E. versions of the LL1660, the core air gap is chosen such that the denoted DC current (18mA for a LL1660/18mA) generates a no signal core flux density of 0.9 Tesla when used with all primaries in series. This leaves a flux density swing of 0.7 T for the signal.

Winding schematics, physical dimensions, pin and mounting hole layout (all dimensions in mm)

Max. current through any single section: 50 mAIsolation between primary and secondary windings / between windings and core: 4 kV / 2 kV

## **Mains Isolation Transformer with Stepup Windings** LL1662

LL1662 is a C-core mains transformer for isolation and DC current elimination. The core is assembled with a carefully selected, very small air-gap to compensate for any mains DC-unbalance. Additional two windings of 10V each are provided to compensate for voltage drop and low mains voltage. Estimated power rating 300 VA, which can be increased with good cooling.

## Tube anode chokes LL1667 and LL1668

The LL1667 and LL1668 are anode chokes for tube amplifiers. The chokes are built with two coils and are using our own special audio C-core. The coils is made using a low capacitance coil winding technique. The two coil structure greatly reduces the risk of picking up hum caused by external magnetic fields from e.g. mains transformers. The LL1667 and LL1668 are available with different core airgaps resulting in different inductance-DC current combinations on request.

## High Current Tube Amplifier Interstage / Line Output Transformer LL1671

LL1671 is a high current interstage / line output transformer for tube amplifiers. The transformer is available with various core air gaps optimised for PP or SE drives.

The transformer is wound with a special low capacitance winding technique to achieve best high frequency performance. The transformer has a special high flux, low distortion audio C-core of our own production. The LL1671PP is assembled with a small core air gap to allow for some DC current unbalance.

For the S.E. versions of the LL1671, the core air gap is chosen such that the denoted DC current (30mA for a LL1671/30mA) generates a no signal core flux density of 0.9 Tesla when used with all primaries in series. This leaves a flux density swing of 0.7 T for the signal.

### Choke LL1673

The LL1673 is a 2 coils choke for tube amplifier anode supply.

The choke is available with different core air-gap, which results in different inductance and DC current capability. LL1673 can be used in choke input and cap input applications.

The coil is wound using our standard high internal isolation technique with isolation foil between each copper layer. The core is an audio C-core of our own production.

## **High Level Tube Amplifier Input Transformer** LL1674

The LL1674 is a large, high signal level audio transformer built with the well know Lundahl amorphous core. The LL1674 consists of two coils, each with a two-sectioned primary winding and a high level secondary winding separated by electrostatic shields. The core is a two-component amorphous strip core. The very high mu of the core results in a phase shift of less than 0.5 degree at 10Hz.

The transformer is magnetically shielded by a mu metal housing.

Turns ratio: 1+1:4+443 x 28 x 21 Dims (Length x Width x Height above PCB (mm)):

Pin layout (viewed from component side) and winding schematics:

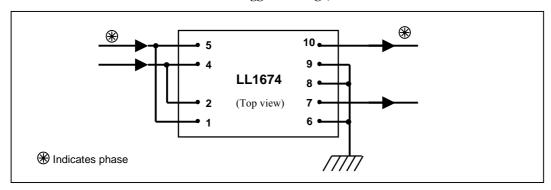

**Spacing between pins:** 5.08 mm (0.2") **Spacing between rows of pins:** 30.48mm (1.2")

Weight: 80 g Rec. PCB hole diameter: 1.5 mm

| Static resistance of each primary (average):                      | 33Ω                                       |

## **High Current Tube Amplifier Interstage Transformer**

LL1677 is a high current interstage transformer with a 1:2 step up ratio.

The transformer is wound with a special low capacitance winding technique to achieve best high frequency performance. The transformer has a special high flux, low distortion audio C-core of our own production. For the LL1677, the core air gap is chosen such that the denoted DC current (80mA for a LL1677/80mA) generates a no signal core flux density of 1.2 Tesla when used with all primaries in series. This leaves a flux density swing of 0.4 T for the signal.

## Moving Coil Input Transformer LL1678

LL1678 is an input audio transformer for moving coil pickups. The transformer is built up from two coils, each coil with one secondary winding surrounded by two primary windings. This structure results in an excellent frequency response. All winding ends are available on the pins. Thus, the transformer can be used with a set of different turn's ratios.

The LL1678 is made with amorphous core material. As this type of core does not store energy (unlike e.g. conventional mu-metal cores) the low frequency resonance with external series capacitors is practically eliminated.

Turns ratio: 1+1+1+1:16+16Dims: (Length x Width x Height above PCB (mm))  $30 \times 22.5 \times 14.5$ 

Pin Layout (viewed from pins side) and windings schematics:

## **Tube Amplifier Output Transformers** LL1679

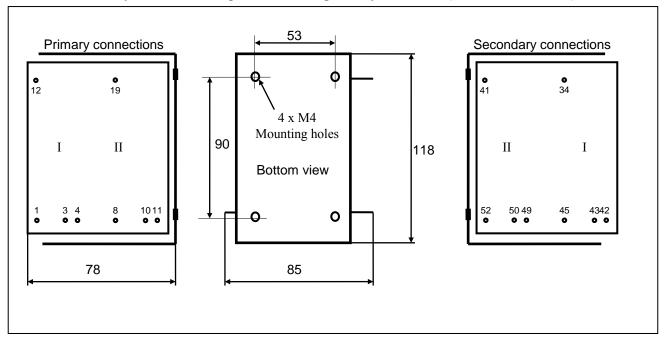

LL1679 is an output transformer for tube amplifiers, available with different core air-gaps for different types of output stages. The transformers are highly sectioned with harmonically sized sections, which results in a minimum leakage inductance. This combined with a low capacitance coil winding technique results in a wide frequency range.

The primary winding can be tapped for 36% UL connection.

The transformers have a special audio C-core of our own production.

The transformers are unpotted, open frame type suitable for mounting inside an amplifier housing.

## **Line Output Transformer for Tube Amplifiers** LL1680

The LL1680 line output transformer is made to match or exceed the specs of the UTC transformer LS-27. The LS-27 was used in the RCA Tube Mike Pre (which was used in BC-2B Consoles).

For the internal insulation of the LL1680 high impedance sections we have used paper (and not polypropylene foil) to minimize internal capacitance. Each coil consists of three sections to optimize leakage inductance versus interwinding capacitance. The transformer has a special audio C-core of our own production.

Turns ratio: 9+9:1+1+1+1

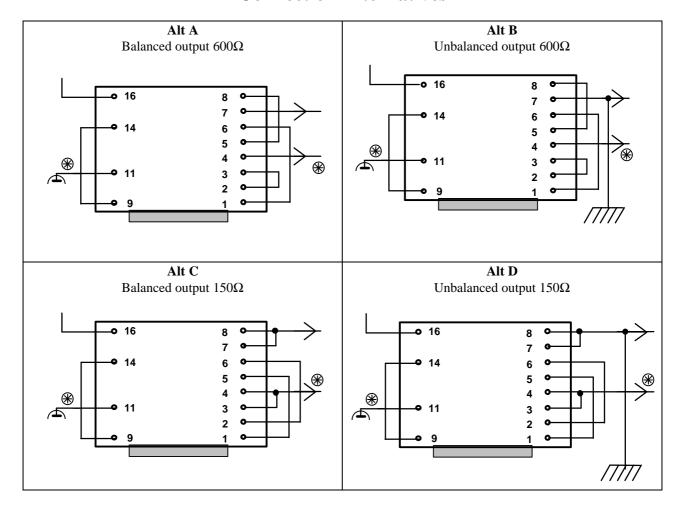

| Weight  | Turns ratio | Static resistance,     | Static resistance,  | Static resistance,  |

## **Moving Coil Input Transformer LL1681**

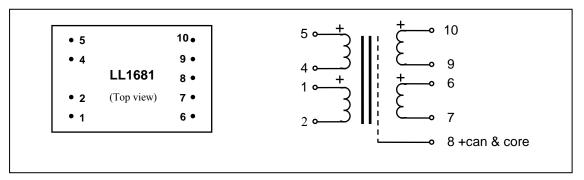

The LL1681 is a large core moving coil input transformer with a mu-metal core.

The LL1681 consists of two coils, each with a two-sectioned primary winding and one high level secondary winding (with paper insulation) separated by electrostatic shields.

The transformer is magnetically shielded by a mu metal housing.

### Tube amplifier output transformer LL1682 5.5k : 5 ohms

The LL1682 is a four-sectioned, dual coil C-core tube amplifier output transformer for 5.5k: 5 ohms impedance ratio available in PP and SE versions.

The coil is wound using our standard high internal isolation technique with isolation foil between each copper layer. The core is an audio C-core of our own production.

## Mains Transformers for Tube Amplifiers LL1683

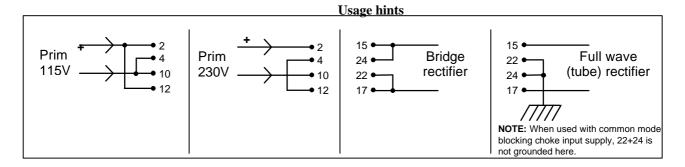

C-core mains transformer. The core is assembled with a small air-gap to compensate for any mains DC-unbalance. Estimated power rating 120 VA, which can be increased with good cooling. The 2 x 250V secondaries are internally divided between the two coils. As a result, the transformer can be used with bridge or full wave rectifiers without a problem of asymmetric load. Magnetic stray is extremely small if filament secondaries of the two coils are loaded identically.

#### Physical dimensions, pin and mounting hole layout (all dimensions in mm)

#### Winding schematics:

## High Level General Purpose Transformer LL1684

LL1684 is a high-level, general-purpose, amorphous core transformer which can be used for microphone or line input, for line output and for galvanic isolation. The windings are arranged to give perfect symmetry if the transformer is used in phase splitting input applications. The two coils structure also greatly improves immunity to external magnetic fields from e.g. power supplies and motors. Primary and secondary windings are separated by electrostatic shields.. The transformer is housed in a mu-metal can.

**Turns ratio:** 1 + 1 : 1 + 1

#### Choke LL1685

The LL1685 is a 2 coils choke for tube amplifier anode supply.

The choke is available with different core air-gap, which results in different inductance and DC current capability. LL1685 can be used in choke input and cap input applications.

The coil is wound using our standard high internal isolation technique with isolation foil between each copper layer. The core is an audio C-core of our own production.

## **Tube Amplifier Output Transformers LL1688**

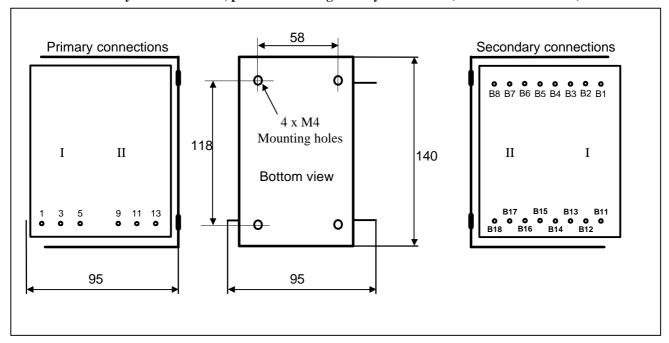

LL1688 is an output transformer, designed primarily for 845 tube amplifiers, but the LL1688 is available with different core air-gaps for different types of output stages. The transformers are highly sectioned with harmonically sized sections, which results in a minimum leakage inductance. This, combined with a low capacitance coil winding technique results in a wide frequency range.

The primary winding can be tapped for 33% UL connection.

The transformers have a special audio C-core of our own production.

The transformers are unpotted, open frame type suitable for mounting inside an amplifier housing.

#### **Line Output Transformer LL1689**

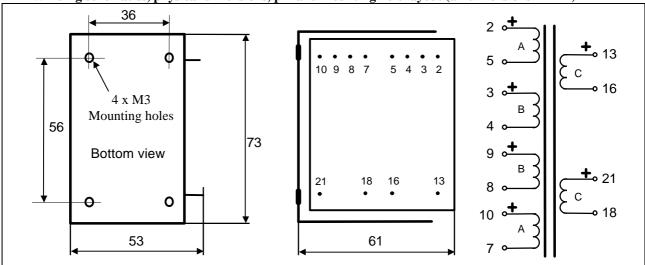

LL1689 is a line output transformer for tube amplifiers. The transformer is available with different core air gap for PP or SE drives.

The transformer primaries are wound with a special low capacitance winding technique to achieve best high frequency performance. The transformer has a special high flux, low distortion audio C-core of our own production.

The LL1689PP is assembled with a small core air gap to allow for some DC current unbalance.

For the S.E. versions of the LL1689, the core air gap is chosen such that the denoted DC current (18mA for a LL1689/18mA) generates a no signal core flux density of 0.9 Tesla when used with all primaries in series. This leaves a flux density swing of 0.7 T for the signal.

# Amorphous Core High Level Line Input Transformer LL1690

LL1690 is a high-level line input transformer with an uncut cobalt-based amorphous strip core. The transformer is designed for high end audio applications such as tube amplifier line input with or without phase splitting. The windings are arranged to give a high degree of symmetry if the transformer is used for phase splitting. The dual-coil structure also greatly improves immunity to external magnetic fields from e.g. power supplies and motors. Primary and secondary windings are separated by electrostatic shields.. The transformer is housed in a mu-metal can.

## **High Level Stepup Line Input Transformer** LL1922

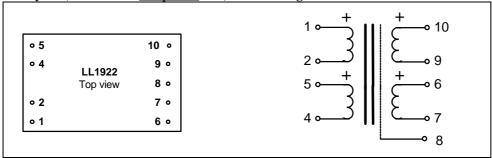

Phone

Fax

LL1922 is a high-level input transformer similar to the UTC LS-10. Thus it is designed for step-up input from 600 ohm sources. To reach the LS-10 freq. response in 1:8 applications with nondifferential amplifier input, the internal Faraday shield must be tied to one of the source lines (the UTC LS-10 does not have any Faraday shield). The two coils structure results in a high immunity to external magnetic fields from e.g. power supplies and motors. Primary and secondary windings are separated by electrostatic shields. The core is a high permeability mu metal core. The transformer is housed in a mu-metal can.

## Audio Transformer LL1926

LL1926 is an audio transformer with a variety of connection alternatives. It is designed for microphone input (step-up) applications, but can also be used as a line input step-down transformer.

The transformer consists of two coils, each with one high impedance winding surrounded by two low impedance windings, with Faraday shields between all sections. The LL1926 has a mu-metal lamination core and is housed in a mu-metal can.

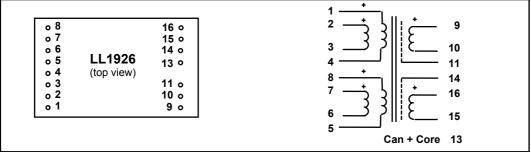

The LL1926 is pin compatible with the amorphous core transformer LL1550, but LL1926 takes up more board space due to the shape of the mu metal laminations.

## **DI Transformer** LL1935

LL1935 is a transformer designed for DI (Direct Input) applications, matching high impedance guitar pickups to low impedance microphone preamp inputs, but is also ideal for 1:10 microphone input applications. The transformer consists of two coils, each with one primary and one secondary winding separated by an electrostatic shield, and a high permeability mu-metal core. The high impedance windings are wound using a special low capacitance winding technique. The transformer is encapsulated in a mu-metal case for magnetic

For best performance, the high impedance side of the transformer (5 + 5) should be connected in series.

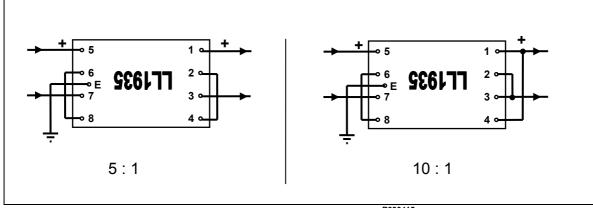

Turns ratio: Dims (Length x Width x Height above PCB (mm)): 1 + 1 : 5 + 538 x 23 x 16

Pin layout (viewed from component side) and winding schematics:

| Spacing between pins:                                       | 5.08 mm (0.2")                           |  |

## Tube microphone output transformer LL1940

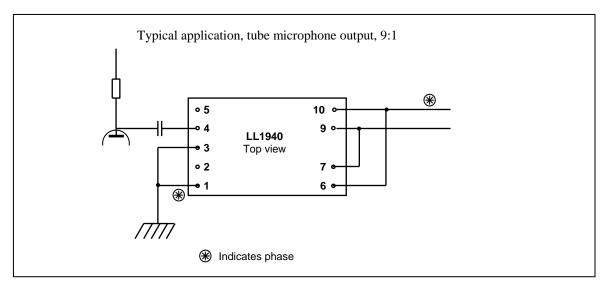

LL1940 is a high turns ratio transformer designed for tube microphones. Conventionally, this type of transformer has a mu metal lamination core for minimum distortion and maximum transparency. For the LL1940 we have chosen a silicon iron C-core (with approx 10 times as high distortion compared to mu metal) to add more "transformer character" to the signal. The transformer has an internal Faraday shield for optimal output balance, but no housing.

**Turns ratio:** 9:1+1

## **Amorphous Core Moving Coil Input Transformer** LL1941

LL1941 is a high turns ratio version of our LL1931 moving coil step-up transformer. The LL1941 transformer combines our unique uncut amorphous cobalt core and our dual coil structure with Cardas high purity copper wire in an oversized design. The objective is to provide the best possible MC transformer, cost-no-object, for low output MC cartridges. The dual-coil structure greatly improves immunity to external magnetic fields from power supplies, motors etc.. The transformer is housed in a mu-metal can.

## Audio Split Transformer LL1944

LL1944 is a four-output splitting transformer to be used with low impedance signal sources. Each of the four secondary windings is surrounded by primary winding sections. In addition to low leakage inductance, this ensures that output signal is maintained (but slightly dropped) on three of the secondary windings even if one of the secondaries is short-circuited, provided that the source is enough low impedance. The primary windings should normally be used in parallel.

Turns ratio: 1+1:1+1+1+1Dims: (Length x Width x Height above PCB (mm))  $47 \times 34 \times 23$

#### **Amorphous Core Line Input Transformer** LL1948

LL1948 is a high-level line input transformer designed with audiophile applications in mind. The LL1948 combines Cardas high purity copper wire windings with our own cobalt-based amorphous core. The transformer is suitable for preamplifier or power amplifier line input with or without phase splitting. The windings are arranged to give perfect symmetry and high noise immunity. The two coil structure also greatly improves immunity to external magnetic fields from e.g. power supplies and motors. Primary and secondary windings are separated by electrostatic shields. The transformer is housed in a mu-metal can.

Turns ratio: 1 + 1 : 1 + 1

Pin layout (viewed from component side) and winding schematics:

# Microphone Input Transformer, Line-box Transformer LL1951

The LL1951 is a high turns ratio microphone input transformers/line-box transformers with high permeability mumetal cores and high bandwidth coils. The LL1951 use the same pin-out as our well known microphone transformer LL1538.

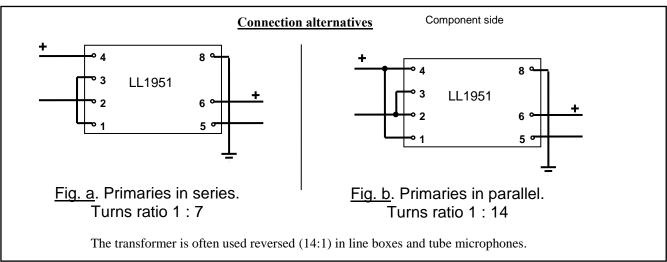

LL1951 is built around two-section coils with Faraday shields between primary and secondary sections. The moderate sectioning results in less internal capacitance, which is suitable for this type of high turns-ratio microphone transformers. The transformers are encapsulated in mu-metal cases for magnetic shielding.

Pin layout (component side view) and winding schematics:

| Dimensions            | Spacing        | Spacing between | Recommended PCB | Weight |

# **Dual (Consumer or Professional) Line Input Transformer LL1952**

The LL1952 is an input transformer with dual primaries (1:4 stepup or 1:1 line input), for equipment which can be used with both consumer and pro audio signal sources. The purpose is to handle signals from both consumer type equipment (1:4) and professional type equipment (1:1) while compensating for the different signal levels. The input signals can be either unbalanced or balanced independently, for instance when using a hybrid connector (XLR and jack) input.

As usual for our input transformers, primary and secondary windings are separated by Faraday shields. The transformer is encapsulated in a mu-metal housing for magnetic shielding.

### **Moving Coil Input Transformer** LL1961

LL1961 is a low turns ratio, low impedance moving coil step-up transformer. The LL1961 transformer combines our dual coil structure with Cardas high purity copper wire in an oversized design. The objective with LL1961 is to provide an alternative suitable for solid state systems, where the classical high turns ratio transformers are not required. The purpose of the Faraday shield is to make galvanic isolation between cartridge and phono-stage possible. The dualcoil structure greatly improves immunity to external magnetic fields from power supplies, motors etc. The core is our unique amorphous cobalt uncut strip core. The transformer is housed in a mu-metal can.

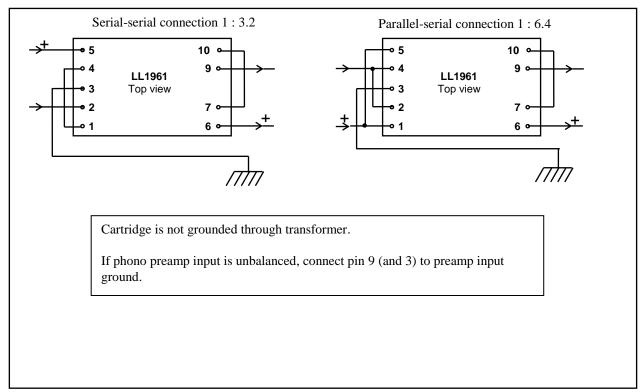

Turns ratio:

### **Moving Coil Input Transformer** LL1963

LL1963 is a low turns ratio, low impedance moving coil step-up transformer. The LL1963 transformer combines our dual coil structure with Cardas high purity copper wire in an oversized design. The objective with LL1963 is to provide an alternative suitable for solid state systems, where the classical high turns ratio transformers are not required. The mu metal laminations results in low distortion and a linear magnetization curve. The purpose of the Faraday shield is to make galvanic isolation between cartridge and phono-stage possible. The dual-coil structure greatly improves immunity to external magnetic fields from power supplies, motors etc. The transformer is housed in a mu-metal can.

## Universal Power Line Transformer LL 2410

LL2410 is a high inductance line transformer for connecting PA system loudspeakers to power lines. The transformer is highly sectioned, with harmonically sized sections, which results in a minimum leakage inductance. The twelve windings can be combined in a number of ways, but symmetry between coil 1 and coil 2 is essential for good performance.

The transformer has a special audio C-core of our own production.

# Ground Isolation, Balanced to Unbalanced Converter LL2615 and LL2616 for 0 dB loss with 10 kΩ load

The XLR inline transformer units LL2615 and LL2616 are used for breaking up ground loops and for balanced-to-unbalanced conversion. In particular, when used with 10 kohms loads transformer signal loss is eliminated through a small step up turns ratio.

The unit is magnetically shielded and contains a high impedance transformer with LF saturation above +15 dBU, 50 Hz.

The LL2615 and LL2616 are available in the following versions:

**LL2615-3FXPHM** Female XLR connector to Phono (RCA) male for 10k unbalanced load **LL2616-3MXPHM** Phono (RCA) male to male XLR connector for 10k balanced load

Cable length 3 ft approximately.

The arrows printed on the labels indicate intended signal direction.

#### **Characteristics of built in transformer**

Static resistance of primary:  $250 \Omega$ Static resistance of secondary:  $280 \Omega$ 

Core: Amorphous strip core
Max level: +15 dBU @ 50 Hz

### **Tube Amplifier Line Output Transformer LL2730 Laurens Organ Company GmbH**

LL2730 is a tube amplifier line output transformer designed for 6:1 applications. For the LL2730/18mA,, the core air gap is chosen such that 18mA DC current generates a no signal core flux density of 0.9 Tesla when used with primaries in series. This leaves a flux density swing of 0.7 T for the signal.

## Tube amplifier output transformer LL2735B 16k: 8 ohms

The LL2735B is a tube amplifier output transformer for 16k: 8 ohms impedance ratio, primarily designed for for high rp tubes such as 10Y, 801A and EML20B in single-end applications. The transformer is a dual coil transformer where coils are wound using our high internal isolation technique with isolation foil between each layer of copper wire. Each coil consist of one primary and two secondary sections. The isolation between primary and secondary sections are gradually increased closer to the tube anode connection in order to minimize capacitive energy storage.

The core is a silicon-iron audio C-core of our own production.

## Tube anode choke LL2743

The LL2743 is an anode choke for tube amplifiers. The choke is built with two coils and are using our own grain-oriented silicon-iron audio C-core. The coils are made using a low capacitance coil winding technique. The two coil structure greatly reduces the risk of picking up hum caused by external magnetic fields from e.g. mains transformers. The LL2743 is available with different core airgaps for different DC currents on request.

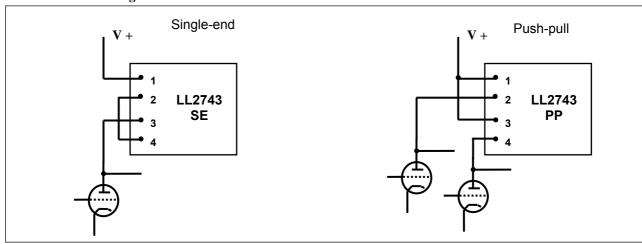

#### Winding schematics, physical dimensions, pin and mounting hole layout (all dimensions in mm)

### **Line Output Transformer LL2745**

LL2745 is a line output transformer for tube amplifiers. The transformer is available with different core air gap for PP or SE drives.

The transformer primaries are wound with a special low capacitance winding technique to achieve best high frequency performance. The transformer has a special high flux, low distortion audio C-core of our own production.

The LL2745PP is assembled with a small core air gap to allow for some DC current unbalance. For the S.E. versions of the LL2745, the core air gap is chosen such that the denoted DC current (18mA for a LL2745/18mA) generates a no signal core flux density of 0.9 Tesla when used with all primaries in series. This leaves a flux density swing of 0.7 T for the signal.

### Stepup 1:2 tube amplifier interstage transformer LL2746 (D)

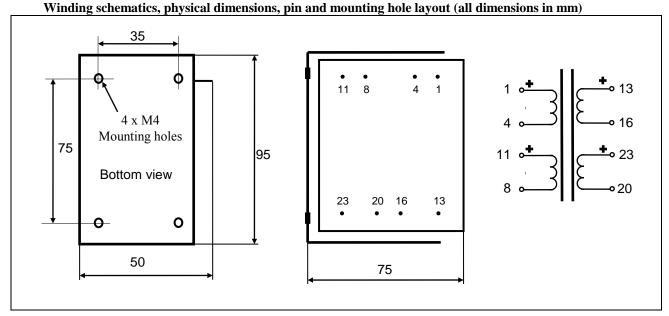

The LL2746 is a three-section dual coil C-core tube amplifier stepup interstage transformer.

The coil is wound using our low capacitance, high internal isolation technique with internal multilayer isolation foil where layer-to-layer signal voltage is big. Winding order is chosen to minimize destructive capacitive energy buildup between primary and secondary sections.

The core is an audio C-core of our own production.

# **Tube Amplifier Output Transformer** LL2752

LL2752 is an output transformer for tube amplifiers, primarily designed for 2k: 8 ohm applications. The LL2752 is available with different core air-gaps for different type of output stages. The transformers are highly sectioned with harmonically sized sections, which results in a minimum leakage inductance. This combined with a low capacitance coil winding technique results in a wide frequency range. The transformers are un-potted, open frame type suitable for mounting inside amplifier housings.

#### Physical dimensions, pin and mounting hole layout LL2752 (all dimensions in mm)

R150220 PL

# Tube amplifier interstage transformer LL2756

The LL2756 is a three-section dual coil C-core tube amplifier interstage transformer.

The coil is wound using our low capacitance, high internal isolation technique with internal multilayer isolation foil where layer-to-layer signal voltage is big. Winding order is chosen to minimize destructive capacitive energy build-up between primary and secondary sections.

The core is an audio C-core of our own production.

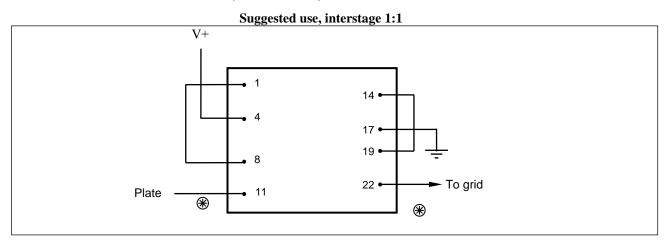

**Turns ratio** 1+1:1+1

Weight: 1.35 kg Static resistance of each primary:  $180 \Omega$ Static resistance of secondary:  $180 \Omega$ Isolation between windings / between windings and core: 4 kV / 2 kV Max recommended DC current through primary windings: 120mA (5W heat dissipation)

# **Mains Transformers for Tube Preamplifiers** LL2758

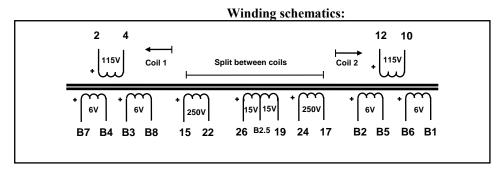

Phone

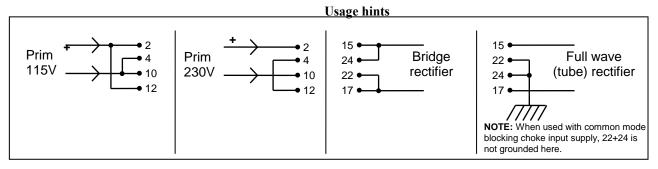

Fax

C-core mains transformer, assembled with a small core air-gap to compensate for any mains DC-unbalance. Estimated power rating 100 VA, which can be increased with good cooling. The 2 x 250V secondaries are internally divided between the two coils. As a result, the transformer can be used with bridge or full wave rectifiers without a problem of asymmetric load. Magnetic stray is extremely small if filament secondaries of the two coils and the 15V-0-15V winding are loaded symetrically.

Physical dimensions, pin and mounting hole layout (all dimensions in mm)

# Line Output Transformer LL2763 and LL2763Ag

LL2763 is a line output transformer for tube amplifiers. The transformer is available in copper or silver wire versions. The transformer primaries are wound with a special low capacitance winding technique to achieve best high frequency performance.

The transformer has a special high flux, low distortion audio C-core of our own production. It is also available with a custom made amorphous C-core. The core air gap will be custom set for your application The PP (Push-Pull) version is assembled with a small core air gap to allow for some DC current unbalance. For the S.E. versions of the LL2763, the core air gap is chosen such that the denoted DC current (7mA for a LL2763/7mA) generates a no signal core flux density of 0.9 Tesla when used with all primaries in series. This leaves a flux density swing of approx. +/- 0.7 T for the signal.

## Choke LL2771

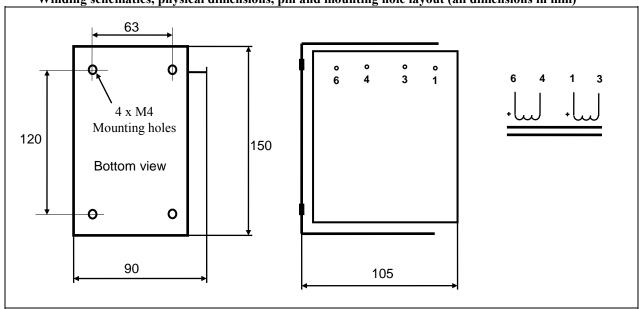

The LL2771 is a big dual-coil choke for high current tube amplifier anode supplies.

The choke is available with different core air-gap, which results in different inductance and DC current capability.

The coil is wound using our standard high internal isolation technique with paper isolation between each copper layer. The core is an audio C-core of our own production.

LL2771 is well suited for choke-input power supplies.

Winding schematics, physical dimensions, pin and mounting hole layout (all dimensions in mm)

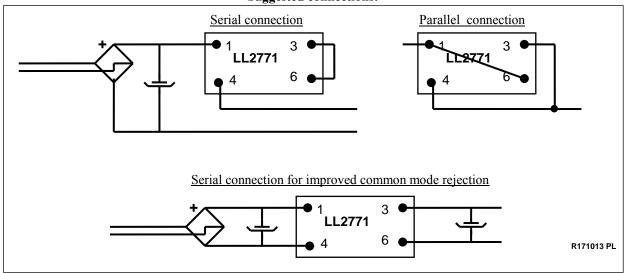

Weight: 4.9 kg 5.6 Ω Static resistance of each winding:

Isolation between windings / between windings and core: 4 kV / 2 kV

# **Audio Output Transformer** LL2811

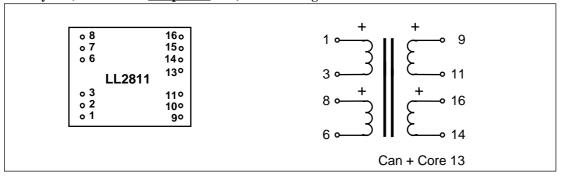

LL2811 is an audio output transformer for balanced drive, with the following features:

- 1. Four section winding structure for small leakage inductance.
- 2. Ideally used 2: 1 (secondaries in parallel) with e.g. NE5532 op amps for low noise.
- 3. Precision made audio C core for small size.
- 4. Two-coil structure and mu-metal housing for high magnetic noise immunity.
- 5. Designed to fit three in a row across a Euroboard.

The secondaries can be connected in parallel for low output impedance or in series for high output level.

# LL3910 = LL1663 with feedback 5k: 8 ohms

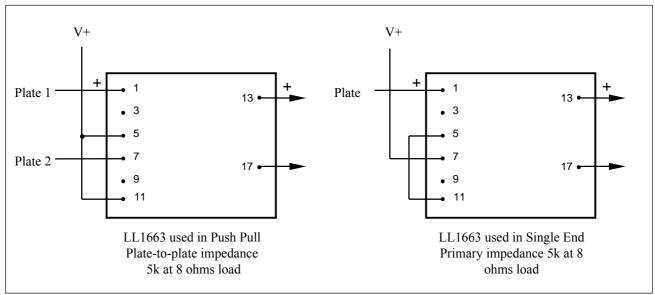

The LL3910 P-P is a four-sectioned dual coil C-core tube amplifier output transformer for 5 k: 8 ohms impedance ratio. The design is based on LL1663, but with a 3.5 ohms low power feedback windning added. The coil is wound using our standard high internal isolation technique with isolation foil between each copper layer. The core is an audio C-core of our own production.

12+12:1+0.44 or (4+8)+(4+8):1+0.44 Turns ratio

Weight: 1.35 kg Static resistance of each primary:  $102 \Omega$ Static resistance of secondary:  $0.4 \Omega$ 4 kV / 2 kV Isolation between windings / between windings and core:

# **Audio Output Transformer** LL5402

LL5402 is an audio output transformer for unbalanced drive, ideally used with mixed feedback drive circuits (see application example below). If primary pins 1 and 5 are connected to ground, the windings are arranged such that cold ends of the primary windings surround each secondary winding. This reduces the effect of capacitance between the primary and the secondary windings.

# Very Small Size Zero Field Input Transformer LL6404

In a Zero Field (ZF) transformer, the magnetic field caused by the input signal should be balanced by a feedback loop which includes the transformer's secondary winding (see schematic below). The feedback arrangement extends the low frequency range (to almost DC!) while maintaining the small size of the transformer. The very small size of the LL6404 requires that the feedback resistor value be very close to the secondary winding resistance.

**Turns ratio:** 1:1Dims (Length x Width x Height above PCB (mm)): 15.5 x 11 x 10

# **Hybrid Transformer LL6702**

LL6702 is a hybrid transformer for telephone applications. It is built using a C-core, and meets requirements for high isolation between windings.

The LL6702 has an extremely low leakage inductance and thus a flat frequency response curve. This makes it easy to design the balancing network for good transhybrid loss in the entire frequency range.

**Turns ratio:** 1.5, 1.5: 1+1Dims (Length x Width x Height above PCB (mm)): 47 x 31 x 15

Pin layout (viewed from component side) and winding schematics:

**Spacing between pins:** 5.08 mm (0.2") Spacing between rows of pins: 30.48 mm (1.2") Weight: 70 g Rec. PCB hole diameter: 1.5 mm Static resistance of primary (pins 1 - 4):  $50\Omega$ Static resistance of balance (pins 2 - 5):  $45\Omega$ Static resistance of each secondary (pins 6 - 7, 9 - 10):  $36\Omega$ Max. DC current: 60 mA 50 dB, 10 Hz - 10 kHz **Transhybrid loss (laboratory conditions):** Isolation between primary and balance windings/ between

#### Typical application: Telephone hybrid using two LL6702:

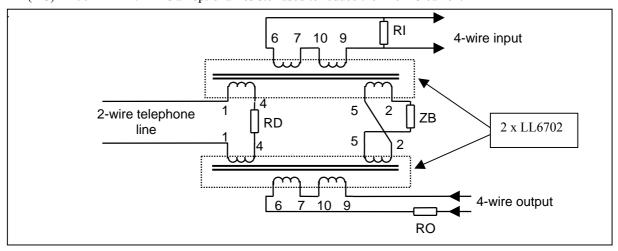

primary and secondary windings:

Balancing network ZB: Select ZB for minimum crosstalk which occurs when ZB equals actual line impedance. In applications, this is often accomplished with a combination of a potentiometer and a series of capacitors **Line termination**: If RI = RO, the termination impedance, **ZT**, as seen from the two-wire side is:

2 kV / 4 kV

**ZT** (AC) = 170  $\Omega$  + RI + RD. Thus, ZT is independent of ZB.

**ZT** (DC) =  $100 \Omega + RD$ . RD is an optional resistor used to reduce the line DC current

# Line Input Transformer LL6807

LL6807 is a small size, high impedance line input transformer.

The transformer consists of two coils each with one primary and one secondary part separated by a electrostatic shield. The secondaries are serially connected internally. The core is a high permeability mu-metal core. Being a high impedance transformer, the LL6807 should normally be used with primaries connected in series. The transformer is housed in a mu-metal box.

Turns ratio: 1 + 1 : 2Dims (Length x Width x Height above PCB (mm)):  $28 \times 18 \times 12$

# LL7904 **High Level Splitting Transformer**

In many splitting applications, the splitting transformer must have a high immunity to input common mode signals, to stray magnetic fields from e.g. power transformers and to large ground potential differences in receiving systems. The LL7904 is developed to handle those types of problems. When designing the LL7904, we have used our wellestablished two-coil structure to create a transformer with a high degree of symmetry. The transformer is built up from two primary windings (which should be used in parallel) and two secondary windings. Each secondary winding is built up from two sections, one from each coil and is surrounded by it own electrostatic shields. The symmetric structure results in an internal cancellation of noise signals caused by external magnetic field (humbucking). It also increases immunity to ground noise between secondary systems and reduces the effects of input common mode signals. The transformer is housed in a mu-metal can and is impregnated in solventless epoxy resin.

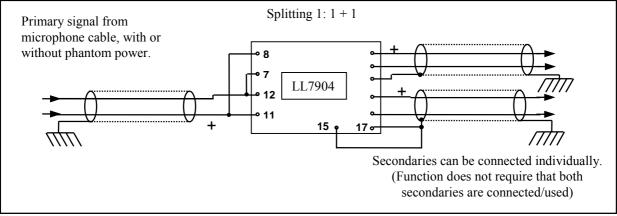

**Turns ratio:** Pin layout (viewed from pins side) and simplified winding schematics:

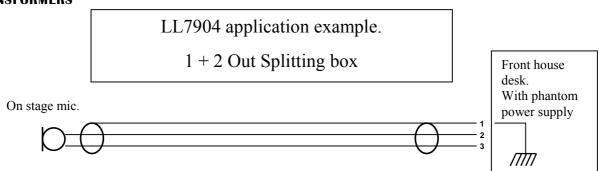

| Spacing between pins | Spacing between rows of pins | Recommended PCB hole diameter: |
|----------------------|------------------------------|--------------------------------|
| 5.08 mm (0.2")       | 5.08 / 45.72 mm (0.2 / 1.8") | 1.7 mm                         |

| Dimensions (Max. L x W x H above PCB(mm))                                      | 66 x 32 x 21                |

# Mic/Line Input Transformer LL7905

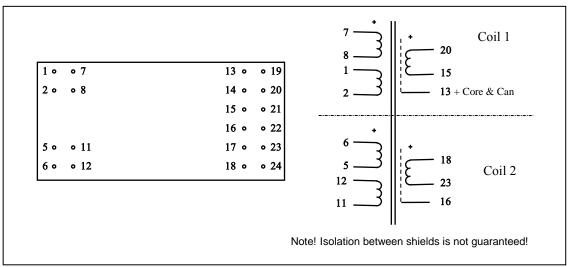

The LL7905 is a large, high level, high performance audio transformer, made for extraordinary requirements. The transformer combines very high secondary level capability (+37 dBU [54.5V rms] @ 50 Hz ) with low copper resistance and is designed for the most demanding applications. The LL7905 consists of two coils, each with two primary and one secondary windings separated by electrostatic shields. The core is a high permeability mu metal lamination core.

The transformer is magnetically shielded by a mu metal case.

# **Audio Transformer/Moving Coil Input Transformer** LL9206

LL9206 is an input audio transformer for moving coil pickups. The transformer is built up from two coils, each coil with one secondary winding surrounded by two primary windings. This structure results in an excellent frequency response. All winding ends are available on the pins. Thus, the transformer can be used with a set of different turn's ratios.

The LL9206 is made with amorphous core material. As this type of core does not store energy (unlike e.g. conventional mu-metal cores) the low frequency resonance with external series capacitors is practically eliminated.

**Turns ratio:** 1 + 1 + 1 + 1 : 10 + 10Dims: (Length x Width x Height above PCB (mm)) 30 x 22.5 x 14.5

# Moving Coil Input Transformer LL9226

LL9226 is an MC transformer based on (and pin compatible with) our classic LL9206, but with reduced copper resistance and level capability. The new design has resulted in an even better frequency response but still with enough no load impedance to maintain the LF bandwidth. The transformer is built up from two coils, each coil with one secondary winding surrounded by two primary windings. Advantages with this structure are excellent frequency response and high immunity to surrounding magnetic fields. All winding ends are available on the pins. Thus, the transformer can be used with a set of different turns ratios.

The LL9226 core is our cobalt based uncut amorphous strip core. The transformer is housed in a mu metal can.

Turns ratio:

# **SIB15** Stereo Isolation and Balancing unit

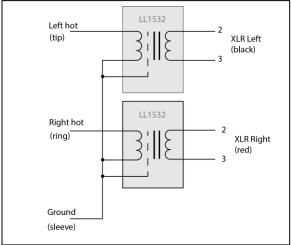

SIB15 is a unit for interfacing between unbalanced audio sources (such as laptops and tablets) and professional, balanced audio systems. In particular in situations where a laptop is the source for both audio and video signals, the SIB15 eliminates the ground loops which are common sources of hum and noise.

SIB15 has a length of 1.8 meters (where length of unbalanced cable is 1.4m), which is enough for most situations.

#### SIB15 provides:

- Full galvanic isolation between all connectors
- True unbalanced-to-balanced conversion
- Robust die-cast aluminum housing

#### **Technical specification:**

Total weight 275 g Total length 1.9 m

Internal transformers 2 x LL1532 Signal level capability at 50Hz +12 dbu / 3V RMS / 8V P-P Signal loss across transformer (load 10k) 0.3 dB Frequency response (source 10 ohms, load 10k) 6Hz – 80kHz +/- 1 dB

Isolation between any two connectors > 1 kV RMS

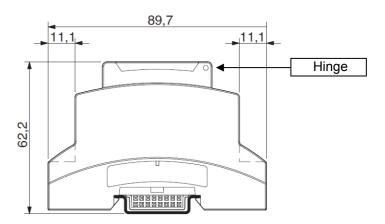

# Transformer unit DIN1527

DIN1527 is a ready-to-use transformer unit with screw terminals. DIN1527 can be used for galvanic isolation, balanced/unbalanced conversion and splitting 1 direct -> 1 direct + 1 isolated output.

As indicated in the name, the unit is designed to fit on DIN rail (EU EN50022, US TS35) profiles, but it also has facilities for screw mounting. The internal transformer is our general purpose LL1527

#### **Transformer DIN unit**

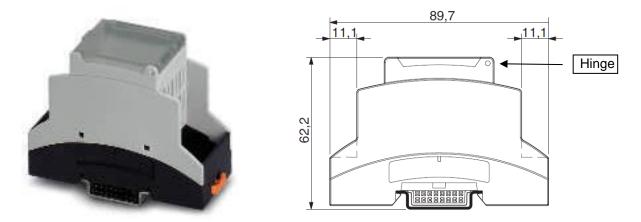

Depending on which transformer you chose, you will need to configure jumper wires on the PCB to match the transformer and meet your needs. On the next page you find the most common configurations. We will be glad to help you with other configurations if the one you need cannot be found here.

#### Recommended work flow:

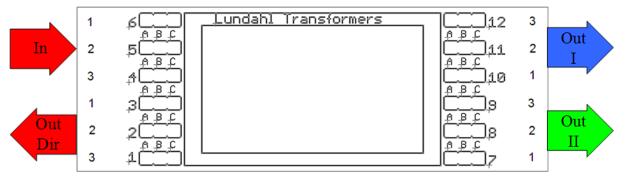

- 1. On the PCB, wire and solder the jumper wires (use insulated wires)
- 2. On the PCB, place and solder the screw terminals
- 3. On the PCB, place and solder the transformer
- 4. Test the assembled board with AC signal (don't use Ohmmeter/DC voltage as this might magnetize the transformer's core)
- 5. Put down the PCB in the DIN base (lower black housing part) until it snaps in
- 6. Take the DIN cover (upper grey housing part) and turn cover hinge side to output side of the PCB
- 7. Place the DIN cover (upper grey housing part) on the base and press it until it snap in place
- 8. Connect wires to screw terminals in the same manner as in XLR connectors (1-GND, 2-Hot, 3-Cold)

#### Housing – Phoenix Contact BC 35,6 - 2TE (2 pitch), Material: polycarbonate

The housing is suitable for use in common installation distributor boxes and complies with the standard DIN 43880. When needed to be installed with screws, pull out the orange mounting flanges. Mounting holes distance is 98mm. Screw Terminals – Phoenix Contact MKDSP 1,5/6 Ratings: Max 300V/10A, Cu wire  $0.05 - 2.1 \text{ mm}^2 / 30 - 14 \text{ AWG}$ 

DIN PCB v1.0 - Top view

#### NOTES:

1-2-3 numbers are indicators for the external wiring which is XLR-like (1-Ground, 2-Hot, 3-Cold). Arrows shows the intended signal flow to/from this unit. Arrow colours mean different GND's (ground references).

Recommended PCB configurations (with reservation for typographical mistakes, inaccuracies or omissions)

#### **Transformer Design Philosophies**

Our transformer design philosophy is based on forty years of experience from manufacturing transformers for a diversity of applications. Our transformers are used in professional audio and hi-fi as well as in power supplies, telecommunications, welding, military applications etc.

We have evolved some unique problem solving strategies when designing transformers, discussed further below, and we design and build our own production machines in order to fulfill otherwise unobtainable transformer design goals.

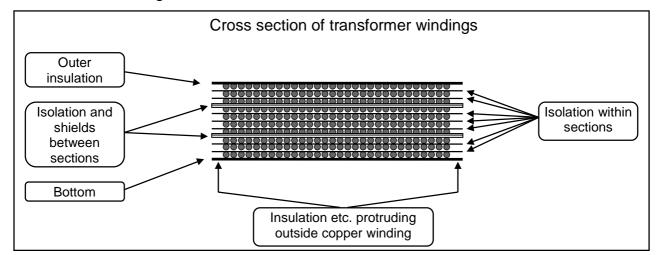

#### 1. Winding technique

Most manufacturers of audio transformers use a conventional bobbin winding system: Within a transformer section, the copper wire is wound in a more or less "random" fashion, and thus the voltage difference between two adjacent wires may be substantial. Transformer sections (such as primary and secondary sections) are separated by isolation film and tape, but the isolation materials is confined by the same bobbin sides as the copper wire. Static shields are also confined to the same limits.

The Lundahl Transformers winding technique does not use bobbins. Our open end winding technique (with insulation between <u>each</u> layer of copper wire <u>within</u> a transformer section) is consistently applied, even for the smallest transformer types and for the thinnest wire dimensions. This gives the following advantages:

- The wire is wound in well-ordered layers. As a result, no wires are crossed and the fill factor is increased (in spite of more insulating material!).
- As additional isolation is applied in the vertical direction, the isolation is reinforced where strong mechanical forces and high voltage differences occur.
- The copper wire is in close contact with low-voltage neighbors of the same layer only.
- Inter-winding capacitance is reduced and reproducible.

Insulation and, if applicable, electrostatic shields are placed between each section, protruding outside the copper wire edges to improve the insulating capability as well as the electrostatic shielding.

#### 2. Dual coil structure.

Our transformers are built up from two coils, each coil with <u>both</u> primary and secondary windings. (It is a common misconception that the primary winding is placed in one coil and the secondary winding is placed in the other. This was the case in high school physics laboratory classes, but such a transformer does not perform very well in the real world.) The dual coil structure has many advantages:

Magnetic immunity is improved with about 40 dB, as a signal caused by an external magnetic field is cancelled between the two coils.

Magnetic stray field is likewise reduced.

CMRR is improved, in particular if windings are used in parallel across the two coils, as plus and minus contributions cancel.

#### 3. Choice of core shape and core materials

In order to meet customer requirements on both electrical and mechanical parameters, we manufacture not only transformer coils, but also cans and C-cores (and machines for can and C-core production) in house. For some applications, we also use amorphous metal cores made in a "inverted toroid technique" developed in house. These manufacturing capabilities give us a large freedom to optimize design also for limited volume applications. We focus on PCB mount transformers as we think this is a rational way of using small size transformers and regularly turn down requests for flying leads.

#### 4. Long lifetime and high insulation requirements

Our winding technique gives us an excellent base for high insulation requirements. A molding process fills empty space in the transformer. When impregnated with epoxy resin, the result is high electrical insulation (normally 4 kV between windings) and excellent mechanical strength.

#### **5. Price / performance considerations:**

Manufacture of high quality audio transformers is, in spite of a semi automated production process, a very labor-intensive task. Cheap transformers can be found in many electronics supply catalogs. However, it is not the transformers you would like to listen to in your application. Truly sound transparent transformers are manufactured by a handful of companies only.

# Mixed feedback drive circuits for audio output transformers

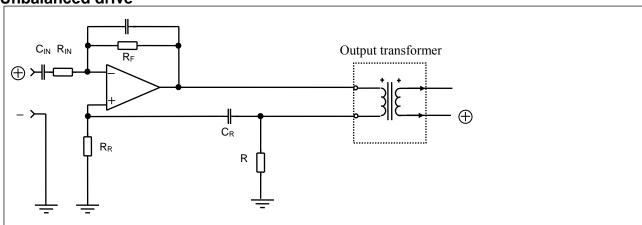

Using mixed feedback drive circuits with audio output transformers have two major advantages:

- 1. Transformer-caused distortion is reduced (or almost eliminated)
- 2. The primary copper resistance of the transformer is eliminated, thus reducing the output impedance correspondingly.

The circuits below illustrate the principles for mixed feedback. In real applications, additional components may have to be added to reach desired performance.

**NOTE!** Application of mixed feedback principles for audio output was covered by a German patent DE 29 01 567 with application day 13.1.79. As far as we understand, the patent has now expired.

#### **Unbalanced drive**

Gain = R<sub>F</sub>/ R<sub>IN</sub> • Transformer turns ratio.

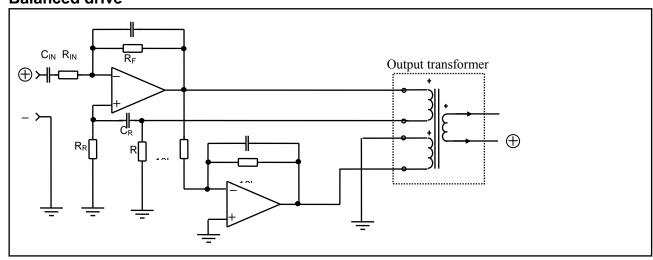

Select R<sub>R</sub> ~ R<sub>IN</sub>

Select  $C_R$  such that  $1/(2\pi \cdot R_R \cdot C_R) \ll F_{MIN}$ , the lowest desired output frequency.

Optimum  $R = R_{primary} \cdot (R_{IN}/R_F)$ , where  $R_{primary}$  is copper resistance of primary winding(s).

Select R for good THD at LF, and for good square wave response

#### **Balanced drive**

Gain =  $2 \cdot R_F / R_{IN} \cdot Transformer turns ratio.$ 

Select R<sub>R</sub> ~ R<sub>IN</sub>

Select  $C_R$  such that  $1/(2\pi \cdot R_R \cdot C_R) \ll F_{MIN}$ , the lowest desired output frequency.

Optimum R <=  $R_{primary} \cdot (R_{IN}/R_F) / 2$ , where  $R_{primary}$  is copper resistance of primary winding(s).

Select R for good THD at LF, and for good square wave response.

# Grounding and shielding.

#### Line Output.

One of the objectives of an output transformer is to give the output line a high <u>and symmetrical</u> impedance versus ground. This is obtained with transformer faradays shield(s) or symmetrical winding arrangements. The symmetry is necessary to prevent mode transfer, i.e. common mode signals picked up by the output line creating differential mode signals (IRT test).

The shield(s) also contributes to output signal balance (IEC test) and to the protection of the output stage from high line voltages caused by lightning.

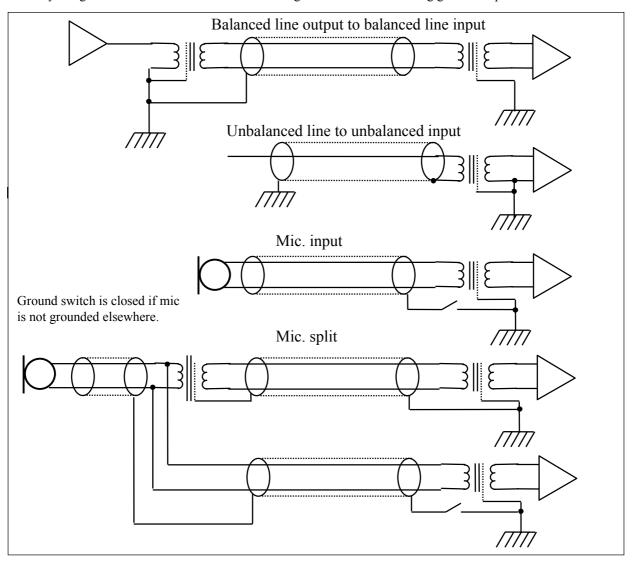

The line shield and the transformer shield / the transformer primary cold connection should be connected to the ground of the line output device.

#### Line Input.

A line input transformer must not allow common mode signals from the line to form differential mode signals (good CMR). For best result, the shield of an input transformer should be connected to the ground of the receiving device. To avoid ground loops, the shield of the line cable should not be connected to this ground.

#### Mirophone Input.

If the mic. is not grounded, the shield of the microphone cable must be connected to the mic amplifier ground, togheter with the shields of the mic input transformer. In case of mic splitting, the grounding scheme must be carefully designed to make shure all cable shields are grounded without creating ground loops.

# Where quality and transformers meet

In conventionally manufactured transformers one have to rely on the enamel isolation of the copper winding wire for electrical isolation within a section. Extra isolation, such as tape and film, is placed only between sections. Within a section, the copper wire is wound in a more or less random fashion, and the voltage difference between two adjacent wires may be substantial. In addition to the risk for short-circuits, the inter-winding capacitance may vary substantially between individual transformers.

As the vast majority of transformers used are produced in this way, transformers have a reputation for unreliability. And the problems are inherent in the construction of the transformers. Thus quality programs which aim at conformity of production (like ISO-9000) can reduce the problems only slightly.

Transformers from LUNDAHL TRANSFORMERS, on the other hand, have a strong reputation for reliability and repeatability. This is a result of a careful design and manufacturing process:

- An open end winding technique with insulation between <u>each</u> layer of copper wire is consequently applied even for the thinnest of wire dimensions. This gives the following properties:
  - 1.1 The wire is wound in well-ordered layers. As a result, no wires are crossed and the fill factor is increased (in spite of more insulating material!).
  - 1.2 As the additional isolation is applied across the vertical direction, the isolation is reinforced where strong mechanical forces and high voltage differences occur.
  - 1.3 The copper wire is in close contact with low-voltage neighbors of the same layer only.
  - 1.4 Winding capacitances are reduced and <u>reproducible</u>.
- 2 Each transformer is submitted to isolation tests prior to molding to correct and sort out potential low isolation voltage candidates.
- 3 A molding process is developed where naked wires are fixated in a ceramic casting.
- Each transformer is impregnated in a pressure and vacuum cycling process where the windings and the mold is soaked with a solventless epoxy resin.
- 5 In the final tests each individual transformer is tested for malfunction and isolation breakdown.
- The production is carried out by our very long-experienced staff (average employment time for our employees is more then 10 years).

Due to our unwillingness to compromise on our ideas on how the ideal transformer should be designed and manufactured, we refrain from manufacturing products where our design principles cannot be applied, such as toroidal transformers. Due to our rather unique concept, we have also been forced to build most of our production machines in house, including e.g. winding machines.

As all companies, we are dependent on the satisfaction of our customers to survive, and we will continue to do our best to retain our customers' confidence. In terms of quality development, our future plans are to document certain key steps in the production process which have not yet been properly documented, and to continue to develop the products and the production process in order to give our customers maximum value for their money.

# Winding arrangements of output transformers

The winding arrangement of an output transformer can be optimized to achieve good common mode rejection and/or good bandwidth. Good CMRR is desirable to avoid mode transfer (common mode signals are transformed to differential mode signals) in the output transformer. This sheet explains the different winding structures for our output transformers

#### With Faraday shield

Faraday shields, placed between the primary and the secondary windings, are used to reduces the capacitive coupling. A transformer with Faraday shield is more complicated to manufacture but can be used with any type of output drive. In our Faraday shielded output transformers, such as the LL1517 and the LL1518 each coil is wound in three sections.

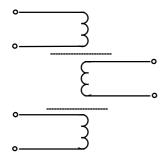

#### Primary cold ends facing secondary winding

The primary and secondary windings can be arranged such that the cold (grounded) side of the primary windning faces the secondary windning. As the voltage swing in this end of the primary windning is only a fraction of the total swing, the capacitive coupling is greatly reduced. This technique requires different winding arrangement for unbalanced drive (e.g. LL5402) or balanced drive (e.g. LL1524).

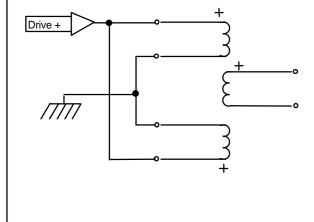

#### Five-section structure for increased bandwidth

In a five-section structure, leakage inductance is minimized almost to the extent of a bifilar wounded transformer. By letting the electrical potential of each layer of the secondary winding follow the potential of the adjecent primary winding, capacitive coupling is reduced, and thus high bandwidth is acheived.

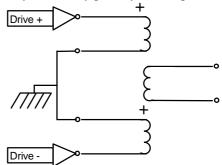

Three section structure with Faraday shields

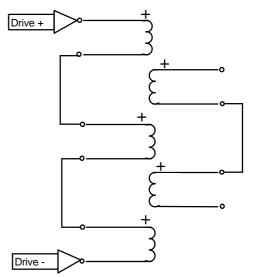

Three section structure, unbalanced drive. The seconday is faced by primary cold ends.

Three section structure, balanced drive. The secondary is faced by primary neutral parts.

Five section structure, balanced drive

Norrtälje, September 22, 2014

# Company statement regarding: the EU directive 2011/65/EU (RoHS2) the EU REACH regulation (SVHC 155 of June 16th, 2014)

From mid June 2005, all soldering at Lundahl Transformers are carried out with lead-free solder. We have also ensured from our suppliers that all materials used in production of our transformers are RoHS-compliant. Thus all transformers manufactured after July 1, 2005 are RoHS compliant.

All Lundahl RoHS-compliant transformers are market with an encircled "F" on the label, except in some very rare cases (e.g. LL6404, LL1572, LL1574....) where the label is too small to accommodate anything but the type number.

In our products or production process, no substances listed in the above REACH regulation are used.
